AB Title compds. I [wherein R1 = (un)substituted 1,3-dihydro-2-oxoimidazolyl, 1,2,3,4-tetrahydroisoquinolinyl, etc.; R2 - R4 = H, alkyl, alkylphenyl, etc.; X, Y = CH or N; m, n = 0 or 1, with limitations] and their pharmaceutically acceptable salts were prepared as ligands of serotonin receptors 1 (5HT1), especially as 5HT1B receptor inhibitors. For instance,

L4 ANSWER 1 OF 177 HCAPLUS COPYRIGHT 2006 ACS on STN (Continued)
was synthesized in 66% yield by Cu-mediated coupling of imidazolone (prepn. given) with 4-bromobenzotrifluoride in the presence of , CuI, K2CO3 and N,N'-dimethylethylenediamine in toluene at 110-120°C for 24 h. Tested compds. I had inhibition against 5HT1B receptor with IC50 values of < 500 nM. Therefore, I and pharmaceutical compns. thereof are useful for treating or preventing depression, anxiety, obsessive compulsive disorder (OCD), and other disorders for which selective antagonists, inverse agonists and partial agonists of 5HT1 receptors, specifically, antagonists of 5-HT1B receptors are useful.

AB The invention discloses a method for treating cancer in a subject. The method comprises administering to a subject suffering from cancer a therapeutically effective amount of a 24-hydroxylase inhibitor in combination with a second amount of a suitable cancer therapeutic. The 24-hydroxylase inhibitor can be coadministered with a chemotherapeutic agent, such an antitumor antibiotic (e.g., mitoxantrone or bleomycin), an alkylating agent (e.g., estramustine or melphalan), a plant alkaloid (e.g., taxanes such as paclitaxel or docetaxel or viva alkaloids such as vincristine or vinblastine) or a combination thereof. In addnl. therapy, the 24-hydroxylase inhibitor can be coadministered as an adjuvant to radiation therapy, such as an external beam irradiation or a radioisotope therapy, such as radiopharmaceutical therapy. Further, the 24-hydroxylase inhibitor can be coadministered as part of a combination therapy that includes hormonal ablation.

LANGUAGE: English

AB One-bead one-compound combinatorial chemical together with a high-throughput screen based on fluorescently labeled enzyme allowed the identification of slow binding inhibitors of human serine racemase (hSR). A peptide library of topog. segregated encoded resin beads was synthesized, and several hSR-binding compds. were isolated, identified, and resynthesized for further kinetic study. Of these, several showed inhibitory effects with moderate potency (high micromolar KIs) toward hSR. A clear structural motif was identified consisting of 3-phenylpropionic acid and histidine moieties. Importantly, the inhibitors identified showed no structural similarities to the natural substrate, L-serine. Detailed kinetic analyses of the properties of selected inhibitors show that the screening protocol used here selectively identifies slow binding inhibitors. They provide a pharmacophore for the future isolation of more potent ligands that may prove useful in probing and understanding the biol. role of hSR.

AB The binding modes of a group of Factor Xa (fXa) inhibitors were studied using FlexX. CoMFA, CoMSIA, HQSAR and SVM models for inhibition potency were constructed with the conformers obtained from the mol. docking. 3D-QSAR models for oral bioavailability were also constructed with the subset inhibitors. The results show that these models possess good prediction ability. The influence of substituents for the activity and oral bioavailability were explored by comparing the constructed 3D-QSAR models. We found that some substituents have consistent effects on inhibition potency and oral bioavailability, but some have inconsistent effects. We observed equally that the different methods involved in this study, such as mol. docking, SVM, HQSAR and 3D-QSAR models, could be used not only for the prediction, but they are also complementary each to other. They are helpful for better understanding the interaction mechanism between inhibitors and fXa receptor.

AB The present invention provides methods of augmenting B cell depletion by promoting intravascular access of B cell subsets sequestered in lymphoid tissues rendering the B cells sensitive to killing mediated by the B cell depleting agent. Certain B lymphocytes residing in tissues and organs, in particular those in the marginal zone of the spleen, are resistant to killing with anti-human CD20 antibody, even though these cells express sufficient levels of CD20 on their surface and are sats. with the administered anti-CD20 antibody. Promoting the egress of these B cells from the tissues in which they are resident into the vascular system and/or prolonging their presence in circulation renders them sensitive to killing by the anti-CD20 antibody. On approach to improving intravascular access of these sequestered B cells is to mobilize them into the circulation with antagonists of integrins that tether these B cells to certain zones in the lymphoid tissues. Thus, B cell mobilizing agents may comprise antibodies binding to the integrin α4 subunit (in α4β1 or α4β7) or αL subunit (αLβ2), or small mol. antagonists of α4 or αL. Depletion of the mobilized B cells is achieved using antagonists of B cell surface markers (CD20, CD22, CD52). Methods of treating B cell disorders by this approach are also provided, including B cell neoplasms and autoimmune diseases.

AB Title compds. represented by the formula I [wherein X = N; Y = O, S or (aryl)amino; Z = CHn or N; n = 0 or 1; R1 = (un)substituted (hetero)aryl, arylalkynyl or heterocyclyl; R2 = H or carboxy; R3 = (halo)aryl, benzyloxy, benzylthio, benzylsulfinyl, benzylsulfonyl; R4 = (un)substituted aryl; R5 = H or alkyl; or an optical isomer, diastereomer or enantiomer thereof; or a pharmaceutically acceptable salt, hydrate or prodrug thereof] were prepared as inhibitors of bacterial type III protein secretion systems. For example, II was provided in a multi-step synthesis starting from the reaction of Me isocyanoacetate with 4-cyanobenzoyl chloride. I were tested for inhibition of the type III protein secretion of the chimeric SopE'-'Bla polypeptide by S. enterica, the SipB polypeptide by S. enterica and effectors from a P. aeruginosa system. Thus, I are useful for the treatment and prevention of bacterial infections, particularly Gram-neg. bacterial infections.

AB The invention relates to peptide-based compds. R5CHR1CONHCHR2CONHCHR3CONHCH4CO-X [X is 2-methyl-2-oxiranyl, 2-methyl-2-thiiranyl or (N-alkyl)-2-methyl-2-aziridinyl; R1-R4 are independently (un)substituted alkyl, hydroxyalkyl, alkoxyalkyl, aryl, aralkyl; R5 is a (functionalized) amino group, a chain of amino acids, a protective group, etc.] or their pharmaceutically-acceptable salts which efficiently and selectively inhibit specific activities of N-terminal nucleophile (Ntn) hydrolases. For example, the chymotrypsin-like activity of the 20S proteasome may be selectively inhibited with the inventive compds. The peptide-based compds. are expected to display anti-inflammatory properties and inhibition of cell proliferation. Thus, Ac-L-hPhe-L-Leu-L-Ser-L-Leu-X [X = (2R)-2-methyloxiranyl, hPhe = homophenylalanyl] was prepared by sequential peptide coupling in solution and showed IC50 values 20S CT-L < 50 nM and cell-based CT-L < 100 nM.

AB A series of 44 dipeptide nitriles with various amino acids at the P2 position and glycine nitrile at position P1 were prepared and evaluated as inhibitors of cysteine proteinases. With respect to the important contribution of the P2-S2 interaction to the formation of enzyme-inhibitor complexes, it was focused to introduce structural diversity into the P2 side chain. Nonproteinogenic amino acids were introduced, and systematic fluorine, bromine, and Ph scans for phenylalanine in the P2 position were performed. Moreover, the N-terminal protection was varied. Kinetic investigations were carried out with cathepsin L, S, and K as well as papain. Changes in the backbone structure of the parent N-(tert-butoxycarbonyl)-phenylalanyl-glycine-nitrile (16), such as the introduction of an R-configured amino acid or an azaamino acid into P2 as well as methylation of the P1 nitrogen, resulted in a drastic loss of affinity. Exemplarily, the cyano group of 16 was replaced by an aldehyde or Me ketone function. Structure-activity relationships were discussed with respect to the substrate specificity of the target enzymes.

AB The flexibility of activated factor X (fXa) binding site was assessed employing ligand-based pharmacophore modeling combined with genetic algorithm (GA)-based QSAR modeling. Four training subsets of wide structural diversity were selected from a total of 199 direct fXa inhibitors and were employed to generate different fXa pharmacophoric hypotheses using CATALYST software over two subsequent stages. In the first stage, high quality binding models (hypotheses) were identified. However, in the second stage, these models were refined by applying variable feature weight anal. to assess the relative significance of their features in the ligand-target affinity. The binding models were validated according to their coverage (capacity as a three-dimensional (3D) database search queries) and predictive potential as three-dimensional quant. structure-activity relationship (3D-QSAR) models. Subsequently, GA and multiple linear regression (MLR) anal. were employed to construct different QSAR models from high quality pharmacophores and explore the statistical significance of combination models in explaining bioactivity variations across 199 fXa inhibitors. Three orthogonal pharmacophoric models emerged in the optimal QSAR equation suggesting they represent three binding modes accessible to ligands in the binding pocket within fXa.

AB The invention provides isolated agents having a core peptidyl or nonpeptidyl (e.g., urea derivative, diketopiperazine derivative) structure, wherein the agent derepresses an IAP-inhibited caspase. The invention also provides a method of derepressing an IAP-inhibited caspase. The method consists of contacting an IAP-inhibited caspase with an effective amount of an agent to derepress an IAP-inhibited caspase. The methods of the invention can be used for promoting apoptosis in a cell and for reducing the severity of a pathol. (e.g., cancer) characterized by reduced levels of apoptosis. Methods for identifying agents that derepress an IAP-inhibited caspase are also provided.

AB The so called "fragment approach" was applied in the search for new leads as selective hNK2 antagonists. A first round of structural space exploration through the use of bond rigidity as scaffold to support the fragments, afforded I as 200 nM hNK2 ligand. Further refinement gave MEN 14933 (II) as a 16 nM hNK2 ligand, selective vs. hNK1, of a novel class. Conformational anal. was used to study results and plan future work.

There is also provided a method for inhibiting protein prenylation comprising contacting an isoprenoid transferase with a compd. of the formula I. These compds., e.g. (II), are useful in the treatment of diseases assocd. with prenylation of proteins, including cancer, restenosis, psoriasis, endometriosis, atherosclerosis, ischemia, myocardial ischemic disorders, elevated serum cholesterol levels, angiogenesis, viral infection, fungal infection, yeast infection, bacterial infection, protozoa infection and corneal neovascularization. An assay for inhibitory activity against GGPTase-I is described, which measures the transfer of isoprenoid from 3H-geranylgeranyl diphosphate (GGPP) into a Ras protein with a C-terminal leucine-for-serine substitution (no data).

AB Standard uses of ligand-receptor docking typically focus on the association of candidate ligands with a single targeted receptor, but actual applications increasingly require comparisons across multiple receptors. This study demonstrates that comparative docking to multiple receptors can help to select homol. models for virtual compound screening and to discover ligands that bind to one set of receptors but not to another, potentially similar, set. A serial docking algorithm is furthermore described that reduces the computational costs of such calcns. by testing compds. against a series of receptor structures and discarding a compound as soon as it fails to satisfy specified bind/no bind criteria for each receptor. The algorithm also realizes substantial efficiencies by taking advantage of the fact that a ligand typically binds in similar conformations to similar receptors. Thus, once detailed docking has been used to fit a ligand into the first of a series of similar receptors, much less extensive calcns. can be used for the remaining structures.

AB We have developed a convenient route for the synthesis of an unsatd. branched sugar bearing a carboxylic acid and an amino group (masked as an azide group) derived from 2-alkoxy-3,6-dihydro-2H-pyran by employing a totally stereoselective Claisen-Johnson rearrangement as the key step. Several Met- and Leu-enkephalin analogs with different substitution patterns at the N- and C-termini were prepared by incorporating this sugar amino acid (SAA) as a substitute for the central Gly-Gly fragment of the parent pentapeptides.

Thus, e.g., II was prepared via amidation of 3-bromo-4-fluorobenzoic acid with L-threonine Me ester hydrochloride followed by substitution with hydroxylamine hydrochloride. This invention pertains generally to treating infections caused by gram-neg. bacteria. More specifically, the invention described pertains to treating gram-neg. infections by inhibiting activity of UDP-3-O-(R-3-hydroxydecanoyl)-N-acetylglucosamine deacetylase (LpxC). Many of I displayed an IC50 value of less than 10 μM with respect to inhibition of LpxC.

AB A new acid-labile, fluorous-tagged protecting group that facilitates the preparation of carboxamides and sulfonamides by parallel solution-phase synthesis is introduced. Its use is exemplified by the preparation of a 27-member library of biaryl sulfonamides and an 18-member library of biaryl carboxamides. Intermediates were purified by solid-phase extraction over reversed-phase fluorous silica gel to afford library members in high yields and purities (>95%) without the need for column chromatog. purification

AB The critical role of signal transducer and activator of transcription 3 (Stat3) in the growth and survival of human tumor cells identifies it as a promising target for cancer drug discovery. We previously identified a Stat3 SH2 domain-binding phosphopeptide, PY*LKTK, and its tripeptide derivs., PY*L and AY*L (where Y* represents phosphotyrosine), which inhibit Stat3 biochem. activity and biol. function. Here, we report novel peptidomimetic compds. based on PY*L (or AY*L) with substitution of the Y-1 residue by benzyl, pyridyl, or pyrazinyl derivs. that are selective and greater than 5-fold more potent in disrupting Stat3 activity in vitro than lead tripeptides. The biol. activities of these derivs. mirror that originally observed for peptides. In this context, the representative peptidomimetic ISS 610 with 4-cyanobenzoate substitution inhibits constitutive Stat3 activity in Src-transformed mouse fibroblasts and human breast and lung carcinoma cells. This effect is not evident with the non-phosphorylated counterpart, ISS 610NP, consistent with interaction of peptidomimetics with the SH2 domain of Stat3. Moreover, ISS 610 induces cell growth inhibition and apoptosis of Src-transformed fibroblasts that contain persistently active Stat3. We present the first report of a peptidomimetic approach to design of small-mol. inhibitors of Stat3 that are also among the first examples of disruptors of transcription factor dimerization with the potential for novel cancer therapy.

AB Title compds. I [wherein Z = CR3R4; P1 = CR5R6; P2 = O, CR7R8, NR9; Y = CR10R11CO, CR10R11CS, CR10R11SO, CR10R11SO2, etc.; X = CR16R17; W = O, S, CO, SO, SO2, NR18; V = CO, CS, SO, SO2, SO2NH, OCO, NHCO, NHSO, NHSO2, OCONH, CONH, CR19R20, C=NCO2R19, C=NCONHR19; U = (un)saturated monocyclic or bicyclic ring which includes 0-4 heteroatoms; R3, R4, R7, R8, R9, R10, R11, R16, R17, R18, R19, R20 = independently H, (cyclo)alkyl, aralkyl; R5 and R6 = independently H, OH, SH, NH2, (cyclo)alkyl(oxy), aryl(alkyl), aryl(alkyl)oxy, (cyclo)alkylthio, aryl(alkyl)thio, (cyclo)alkylamino, aryl(alkyl)amino, etc.; m = 0-3; n = 0-1; p = 0-3; and their salts, hydrates, solvates, complexes, and prodrugs] were prepared via solid phase and solution phase synthetic methods as inhibitors of cathepsin K and other cysteine proteases. For example, (3aS,6aR)-3-oxohexahydropyrrolo[3,2-b]pyrrole-1,4-dicarboxylic acid 1-tert-Bu ester 4-(9H-fluoren-9-ylmethyl) ester (several alternate multi-step solution phase prepns. given) was converted to the building block-linker construct and loaded to the solid phase. Reaction with Fmoc-Leu-OH (HBTU, HOBT, NMM in DMF), followed by standard Fmoc deprotection, sequential rounds of coupling with 4-tert-butylbenzoic acid (HBTU, HOBT, NMM in DMF) and benzoic anhydride (NMM in DMF), and washing with appropriate reagents provided II (R = Bu-t). The related compound II (R = 2-thienyl) inhibited human cathepsin K, cruizipain, bovine cathepsin S, human cathepsin L, and cysteine protease B peptidase activity with Ki values of <0.01 μM, >0.3 μM, >1 μM, >3 μM, and >0.2 μM, resp. Selected compds. of the invention suppressed bone resorption stimulated by human peripheral blood monocytes by >70% at a concentration of 100 nM. Thus, I and their pharmaceutical compns. are useful for the treatment of osteoporosis, Paget's disease, gingival diseases, such as gingivitis and periodontitis, hypercalcemia of malignancy, metabolic bone disease, diseases involving matrix or cartilage degradation, in particular osteoarthritis and rheumatoid arthritis, and neoplastic diseases (no data). The compds. are also useful for validating therapeutic target compds. (no data).

AB We report the first detection of triplet alkyl nitrenes in fluid solution by laser flash photolysis of α-azidoacetophenone derivs. p-RC6H4COCH2N3, 1. Azides 1 contain an intramol. triplet sensitizer, which ensures formation of the triplet alkyl nitrene by bypassing the singlet nitrene intermediate. At room temperature, azides 1 cleave to form benzoyl and Me azide radicals in competition with triplet energy transfer to form triplet alkyl nitrene. The major photoproduct p-RC6H4COCH2NHCOC6H4R-p, 3, arises from interception of the triplet alkyl nitrene with benzoyl radicals. The triplet alkyl nitrene intermediates are also trapped with mol. oxygen to yield the corresponding 2-nitrophenylethanone. Laser flash photolysis of 1 reveals that the triplet alkyl nitrenes have absorption around 300 nm. The triplet alkyl nitrenes were further characterized by obtaining their UV and IR spectra in argon matrixes. 13C and 15N isotope labeling studies allowed us to characterize the C-N stretch of the nitrene intermediate at 1201 cm-1.

AB 1α,25(OH)2D3 exerts antiproliferative, differentiating effects on many cell types, including cancer tissues. In most of its target cells, levels of 1α,25(OH)2D3 are regulated by local synthesis via CYP27B and metabolism via CYP24. Rapidly induced by vitamin D, CYP24 repeatedly hydroxylates the vitamin D side chain and ultimately terminates hormonal activity. Aiming at increased hormone levels, lifetime and function, numerous vitamin D analogs were synthesized with structural modifications, which impede oxidation of the vitamin D side chain. The authors' group followed a different strategy, namely, blocking 1,25(OH)2D3 metabolism with inhibitors of CYP24. As appropriate inhibitors, the authors exploited compds. termed azoles, which directly bind to the heme iron of the CYPs via an azole nitrogen and to other parts of the substrate site. The authors synthesized some 400 azoles and tested their potential to selectively inhibit CYP24, but not hormone synthesis by the related CYP27B. Using primary human keratinocyte cultures as the source of CYP24 and CYP27, the authors discovered some 50 inhibitors of CYP24 with IC50 values in the nanomole range and selectivities up to 60-fold. As the first representative of selective CYP24 inhibitors, VID400 underwent preclin. development. In human keratinocytes, VID400 stabilized levels of endogenously produced 1α,25(OH)2D3, and thereby strongly amplified and prolonged expression of CYP24, a surrogate marker of hormonal function. In parallel, antiproliferative activity showed up at 100-fold or more lower concns. of 1α,25(OH)2D3. This data suggests that CYP24 inhibitors could become attractive drugs in antiproliferative therapy, used as single entities to increase or extend endogenous hormone function or in combination with low doses of potent analogs. Moreover, the authors used selective inhibitors as valuable tools to (a) elucidate regulatory mechanisms of vitamin D synthesis and metabolism, (b) determine intrinsic activities of the otherwise highly, transient vitamin D metabolites and (c) model the active sites of CYP24 and CYP27B.

AB Title compds. I [wherein R1 = alkyl, alkenyl, alkynyl, aryl, heteroaryl, (3-8-membered)-cycloalkyl, heterocycloalkyl, (alkyl)aryl, (alkyl)heteroaryl, (alkenyl)aryl, heteroaryl, (alkynyl)aryl, heteroaryl; R2, R3 = independently H or alkyl; Cy = aryl, heteroaryl, cycloalkyl, heterocyclyl; with the proviso that four compds. are excluded; their geometrical isomers, optically active forms as enantiomers, diastereomers and racemates, and pharmaceutically acceptable salts and active derivs.] were prepared as inhibitors of protein tyrosine phosphatases (PTPs), in particular PTP1B. Examples include over 400 invention compds., five pharmaceutical formulations, and two biol. assays. For example, II was prepared in 4 steps by amidation of 4-formylbenzoic acid with dodecylamine in THF in the presence of 4-methylmorpholine and iso-Bu chloroformate for 3 h at room temperature, reductive amination with 4-trifluoromethylbenzylamine in DCE in the presence of NaBH(OAc)3, TEA-acylation with chlorooxoacetic acid Et ester in THF, and base-catalyzed hydrolysis of the ester. II exhibited an IC50 value of 2.224 μM for inhibition of PTP1B, 1.40 μM for GLEPP-1, 2.40 μM for SHP-1, and 2.70 μM for SHP-2 in an in vitro assay. In an in vivo postprandial glycemia model in db/db mice, II, at 20-200 mg/kg orally, decreased blood glucose level by 17% at 20 mg/kg, by 42% at 100 mg/kg, and by 48% at 200 mg/kg, with decreases in serum insulin levels of -21, 66%, and 89%, resp. Thus, I and their formulations are useful for the treatment and/or prevention of metabolic disorders mediated by insulin resistance or hyperglycemia, comprising diabetes type I and/or II, inadequate glucose tolerance, insulin resistance, hyperlipidemia, hypertriglyceridemia, hypercholesterolemia, obesity, polycystic ovary syndrome (PCOS).

AB The invention provides isolated agents having a core peptidyl or nonpeptidyl (e.g. urea derivative, diketopiperazine derivative) structure, wherein the agent derepresses an IAP-inhibited caspase. The invention also provides a method of derepressing an IAP-inhibited caspase. The method consists of contacting an IAP-inhibited caspase with an effective amount of an agent to derepress an IAP-inhibited caspase. The methods of the invention can be used for promoting apoptosis in a cell and for reducing the severity of a pathol. (e.g. cancer) characterized by reduced levels of apoptosis. Methods for identifying agents that derepress an IAP-inhibited caspase are also provided.

AB (R3Y)(R1X)NUR2 [n = 0-5; X, Y = CH2, CO, SO2, CONH; R1 = (substituted) aryl, aralkyl, heteroaryl, heteroarylalkyl; R2 = (substituted) heteroalkyl, aryl, aralkyl, heteroaryl, heteroaralkyl, cycloalkyl, heterocycloalkyl, heteroalkylcycloalkyl; R3 = (substituted) alkyl, alkenyl, alkynyl, heteroalkyl, cycloalkyl, alkylcycloalkyl, heterocycloalkyl, heteroalkylcycloalkyl, aryl, heteroaryl, heteroarylalkyl, aralkyl], were prepared Thus, N-(4-benzyloxy-3-methoxybenzyl)-N-(2-pyridin-2-ylethyl)amine (preparation given) in ClCH2CH2Cl was treated with polymer-supported morpholine and 2-chlorobenzoyl chloride followed by stirring for 24 h. Polymer-supported isocyanate, polymer-supported tris(2-aminoethyl)amine, and ClCH2CH2Cl were added followed by stirring for 24 h to give 84% N-(4-benzyloxy-3-methoxybenzyl)-N-(2-pyridin-2-ylethyl)-2-chlorobenzamide. Title compds. showed IC50's of 5-60 μM in secondary luciferase assays in NIH3T3, CHO, or HEK293 cells.

OTHER SOURCE(S): CASREACT 138:221700
AB The invention provides novel solid supports comprising dihydroxyalkyl aminoalkyl and dihydroxyalkylaminobenzyl groups [e.g., N,N-diethanolaminomethyl polystyrene, (I)], and methods for making and using them. The supports are particularly useful for immobilizing and derivatizing functionalized boronic acids for use in solid phase synthesis, such as those used in combinatorial chemistries. For example, when I is coupled with p-MeC6H4B(OH)2 the corresponding resin bound arylboronic acid is formed nearly quant. The compns. and methods of the invention are also useful as scavenger solid supports, e.g., in solution-phase parallel synthesis of small mol. libraries, and for use in resin-to-resin transfer reactions via phase transfer of solid supported boronic acids under both aqueous and anhydrous conditions. The methods of the invention provide convergent solid-phase synthesis of sym. or unsym. functionalized compds., such as biphenyl compds. Also provided are synthesizer devices, e.g., semiautomated parallel synthesizers.

AB An improved method for the preparation of a series of oxazole-containing dual PPARα/γ agonists, e.g., I, is described. A synthetic sequence utilizing a Dakin-West reaction was devised that allows for the introduction of the oxazole ring either late in the synthetic sequence via aminomalonate-derived chemical or in pivotal SAR intermediates derived from aspartic acid.

I

AB The invention relates to a method of deriving a peptidomimetic of a biol. active metallopeptide. The peptidomimetic contains at least one non-peptide ring structure and at least two amino acid-related elements. The invention further relates to peptidomimetics with a template space heterocyclic ring structure, including 5-, 6- and 8-membered and 5-5 and 6-5 bicyclic fused ring structure melanocortin receptor-specific peptidomimetics. The examples describe the synthesis of pyrrolidines, 2-piperazinones [e.g., I [R = BuCH2CH2CO-Ser(Bzl)-D-Phe(2-Cl)]], hexahydropyrrolo[1,2-a]pyrazin-4-ones, hexahydropyrrolo[1,2-a]imidazol-3-ones, 1,4-benzodiazepines, and piperazines. Competitive inhibition testing of compound I against α-MSH yielded the following results at 1 μM: melanocortin-1 receptor (MC1-R) 96%, MC3-R 51%, MC4-R 99%, and MC5-R 82%.

AB The structures of the noncovalent complex of human factor Xa (fXa) with four non-peptide inhibitors containing a central sulfonylpiperazinone scaffold have been determined to about 2.1 Å resolution Highly potent fXa inhibitors containing both neutral groups such as chlorobenzothiophene or chlorothiophene and basic groups such as benzamidine were shown to interact in the S1 pocket through the neutral group whereas the S4 pocket is occupied by the basic moiety. The scaffold comprising the sulfonyl keto piperazine moiety might play a pivotal role in the orientation of substituents, since there is a strong hydrogen bond between Gly219 of fXa and the carbonyl oxygen of the piperazine. This unique reverse binding mode is heretofore unreported in fXa and shows that electrostatic interactions in the S1 subsite are not an absolute requirement to maintain high affinity. Selectivity against other serine proteases can be readily explained in light of these structural results. It has opened up new prospects for designing fXa inhibitors with increased oral bioavailability.

AB 9-Anthroyl derivs. of some aromatic amines exhibit unusual fluorescence characteristics. In solvents of low and medium polarity (hexane, chloroform, DMF, and tert-butanol), their emission maxima are shifted to longer wavelengths as compared to the spectra recorded in polar solvents (ethanol and methanol); the red shift is accompanied by an increase in the fluorescence quantum yield. Possible reasons of such an anomalous spectral shift are discussed.

AB There has been intense interest in the development of factor Xa inhibitors for the treatment of thrombotic diseases. Our laboratory has developed a series of novel non-amidine inhibitors of factor Xa. This paper presents two crystal structures of compds. from this series bound to factor Xa. The first structure is derived from the complex formed between factor Xa and compound 1. Compound 1 was the first non-amidine factor Xa inhibitor from our laboratory that had measurable potency in an in vitro assay of anticoagulant activity. The second compound, 2, has a molar affinity for factor Xa (Kiapp) of 7 pM and good bioavailability. The two inhibitors bind in an L-shaped conformation with a chloroarom. ring buried deeply in the S1 pocket. The opposite end of these compds. contains a basic substituent that extends into the S4 binding site. A chlorinated Ph ring bridges the substituents in the S1 and S4 pockets via amide linkers. The overall conformation is similar to the previously published structures for amidine-based inhibitors complexed with factor Xa. However, there are significant differences in the interactions between the inhibitor and the protein at the atomic level. Most notably, there is no group that forms a salt bridge with the carboxylic acid at the base of the S1 pocket (Asp189). Each inhibitor forms only one well-defined hydrogen bond to the protein. There are no direct charge-charge interactions. The results indicate that electrostatic interactions play a secondary role in the binding of these potent inhibitors.

AB The invention features guanylhydrazone compds. R1C(:X)C6H4CONHCH(CH2R2)CON(R3)(CH2)mN(R4)COCH(CH2R5)NHCOC6H4C(R6):NNHC(:NH)NH2 (I; R1,R6 = alkyl, aryl; R2,R5 = H, alkyl, aryl; R3,R4 = H, alkyl; X = O, H2N(HN:)CNHN-; m ≥ 2) that inhibit secretion of a protein encoded by an AU-rich element-containing (ARE)-mRNA or that modulate regulation of an ARE-mRNA. I are useful for the treatment or prevention of conditions involving proteins encoded by ARE-mRNAs, such as tumor necrosis factor α, interleukins, interferons, and cyclooxygenases 1 and 2. Such conditions include inflammation, arthritis, autoimmune diseases, septic shock, blood clotting, and stroke. Thus, compds. were tested in a high-throughput, macrophage-based luciferase reporter assay. Mouse 264.7 cells transformed with an expression vector containing the luciferase gene flanked by CMV promoter and tumor necrosis factor α 3'-UTR were used. Compds. identified in this assay were tested for their ability to inhibit tumor necrosis factor α secretion.

AB The Nα-methylation at Lys in the peptide sequence Cpa-cyclo[DCys-Tyr-DTrp-Lys-Thr-Cys]-Nal-NH2, which increases the GH release inhibitory potency and type 5 affinity, was studied further to search for addnl. potent antagonists. Synthetic analogs were tested for their ability to inhibit somatostatin-inhibited GH release from rat pituitary cells in culture and to displace 125I-labeled somatostatin from CHO cells transfected with the 5 known human somatostatin receptors. Replacement of lipophilic Nal12 at the C-terminus with a hydrophilic His12 resulted in increased affinity and selectivity for the type 2 receptor. When the C-terminus was replaced by Tyr12, it resulted in high selectivity for sst2, but with decreased affinity and potency. The effect of dimerization of the peptide ligands using linkers of varied flexibility and hydrophilicity was studied. In the first experiment 4,4'-biphenyldicarboxylic acid was used to generate a bivalent peptide ligand on the resin. The generated bivalent peptide ligand bound to type 2 receptor with good selectivity, but it was 34-fold less potent than the monovalent ligand in the GH release assay.

* STRUCTURE DIAGRAM TOO LARGE FOR DISPLAY - AVAILABLE VIA OFFLINE PRINT *

AB Monoamidine FXa inhibitors, e.g. I (R = H, Me, Ph, PhCH2), were designed and synthesized. SAR studies and mol. modeling led to the design of conformationally constrained diaryl ethers, e.g. II [X = C(O)NH, NHCO], as well as benzopyrrolidinone III as potent FXa inhibitors. The monoamidines show high efficacy in a DVT model, but lack desirable oral bioavailability. The benzopyrrolidinone-based aminoisoquinolines, e.g. IV, do not show significant improvement in oral bioavailability.

AB Further optimization of the β-aminoester class of factor Xa (fXa) inhibitors is described culminating in the identification of FXV673, a potent and selective factor Xa inhibitor with excellent in vivo anticoagulant activity. An x-ray structure of FXV673 bound to human fXa is also presented. Based on its selectivity, potent in vivo activity and favorable pre-clin. safety profile, FXV673 was selected for further development and is currently undergoing clin. trials.

AB A systematic modification of the C3 side-chain of the β-aminoester class of factor Xa inhibitors and a survey of P4 variations is described. These changes have resulted in the identification of sub-nanomolar inhibitors with improved selectivity vs. related proteases. Coagulation parameters (i.e., APTT doubling concns.) are also improved.

AB Previous studies from this laboratory demonstrated that N-methylation at Lys5 residue in somatostatin octapeptide antagonist analogs increased the GH release inhibition potency by as much as 300%. The authors have now further investigated N-methylation of this Lys5 residue in conjunction with a number of N- and C-terminal modifications previously found to give highly potent somatostatin receptor antagonists. Synthetic analogs were tested in a functional assay for their ability to inhibit somatostatin-inhibited GH release from rat pituitary cells in culture and to displace 125I-labeled somatostatin from CHO cells transfected with the five known human somatostatin receptors. Several interesting observations resulted from the study. Replacement of lipophilic Nal8 at the C-terminus with a hydrophilic His8 resulted in the increased affinity and selectivity for type 2 receptor to give the most potent antagonist analog yet discovered (Ki, 1.5 nM), although in the rat pituitary cells inhibitory activity on somatostatin inhibited GH release decreased somewhat. A His3 substitution within the cyclic portion of the analogs retained pituitary cell potency and affinity for type 2 receptor as did substitution with Bip8 and Fpa1. Replacement of Cpa1 with Iph1 did not effect the affinity for type 2 receptor significantly, but did decrease the effects on rat cell GH release. Iph3 within-ring substitution increased the selectivity for sst2 appreciably although the affinity for that receptor was considerably decreased. Substitution of Npa3 resulted in good selectivity for sst2 receptor. Replacement of Nal8 with D-Trp8 also increased the selectivity for type 2 receptor. Use of a 'bivalent ligand' approach in which two peptides were joined by 4,4'-biphenyldicarbonyl as a spacer destroyed the affinity for all the subtypes, however, the bivalent ligand formed with the Ahp spacer displayed significant affinity and high selectivity for the type 2 receptor.

AB A general method for the triflation of phenols on multipin solid supports (Rink-MA/DMA polyethylene-grafted crown ether derivs.; SynPhase-MD crowns from Chiron Technologies, Melbourne, Australia) followed by Suzuki cross coupling reaction with aryl boronic acids was developed. This methodol. was extended to the arylation of tyrosine containing peptides. The triflate derivs. used in this synthetic method were multipin-crown-supported N-[[4-[(trifluoromethyl)sulfonyl]oxy]benzoyl]-L-phenylalaninamide and N-[[3-[(trifluoromethyl)sulfonyl]oxy]benzoyl]-L-phenylalaninamide. Multipin-crown-supported [(trifluoromethylsulfonyl)tyrosinyl]-L-phenylalaninamide derivs. and analogs, i.e., N-[2-[[(1,1-dimethylethoxy)carbonyl]amino]-1-oxo-3-[3-[[(trifluoromethyl)sulfonyl]oxy]phenyl]propyl]-L-phenylalaninamide, and N-[2-[[(1,1-dimethylethoxy)carbonyl]amino]-1-oxo-3-[4-[[(trifluoromethyl)sulfonyl]oxy]phenyl]propyl]-L-phenylalaninamide were prepared starting from N-[(1,1-dimethylethoxy)carbonyl]-3-[(2-propenyl)oxy]phenylalanine and N-[(1,1-dimethylethoxy)carbonyl]-O-2-propenyltyrosine, resp., and 1,1,1-trifluoro-N-phenyl-N-[(trifluoromethyl)sulfonyl]methanesulfonamide.

I [R1 = H, OH, halo, amino, monoalkylamino, trifluoromethyl, aminomethyl, cyano, nitro, carboxy, (un)substituted heteroaryl; R2 = H, OH, halo, alkyl, alkoxy, alkoxyalkyl, hydroxyalkyl, alkenyl, amino, mono- or dialkylamino, cyano, nitro, trifluoromethyl, carboxy, carboxamido, (hetero)aryl; R3-5 = H, OH, halo, alk(en)yl, cycloalkyl, CN, carboxy, carboxamido, (hetero)aryl; A = alk(en/yn)yl, acyl, S(O)2R7, C(O)NHR7, CO2R7, (CH2)nS(O)qR7, (CH2)pC(O)R7, (CH2)pC(O)NHR7, (CH2)pCO2R7, (CH2)nOR7, (hetero)aryl; B = H, alk(en/yn)yl(CH2)nS(O)qR7, (CH2)pC(O)R7, (CH2)pC(O)NHR7, (CH2)pCO2R7, (CH2)nOR7, aryl, heteroaryl, arylalkyl, arylalkenyl, arylalkynyl, heteroarylalkyl, heteroarylalkenyl, heteroarylalkynyl, etc.; n = 2 - 4; p = 1 - 2; q = 0 - 2; R7 = alkyl, aryl, heteroaryl, arylalkyl, heteroarylalkyl] were prepared Over 50 synthetic examples were disclosed. For instance, (S)-3-iodotyrosine was converted to the N-Boc-O-benzyl derivative and converted to 5-[(2S)-2-benzyloxycarbonyl-2-((tert-butoxycarbonyl)amino)ethyl]-2-(hydroxy)benzoic acid Me ester (CH3CN, Pd0Ac2, dppf, Et3N, CO/1 atm, 68 °C). This phenol was O-alkylated with Me bromomethylacetate (acetone, K2CO3, 50°C), debenzylated (EtOHaq, palladium hydroxide, H2-1 atm), coupled to 4-methoxybenzyl amine (CH2Cl2, EDC), treated with TFA (CH2Cl2), sulfonylated (PhSO2Cl, pyridine, 0°C) and finally saponified (THFaq) to afford II. II and selected example compds. had Ki = 0.01 μM - 1000 μM for CDC25A phosphatase and PTP-1B. I are useful in the treatment or prevention of diabetes mellitus.

AB Boronic acid-containing mols. are employed in a broad range of biol., medicinal, and synthetic applications. These compds., however, tend to be difficult to handle by solution-phase methods. Herein, this problem is addressed with the development of the first general solid-phase approach for the derivatization of functionalized boronic acids. This approach is based on the use of a diethanolamine resin anchor that facilitates boronic acid immobilization by avoiding the need for exhaustive removal of water in the esterification process. The immobilization of a wide variety of boronic acids onto N,N-diethanolaminomethyl polystyrene (DEAM-PS, 1) can be performed within minutes by simple stirring in anhydrous solvents at room temperature Evidence for the formation of a bicyclic diethanolamine boronate with putative N-B coordination was shown by 1H NMR anal. of DEAM-PS-supported p-tolylboronic acid. The hydrolytic cleavage of the same model boronic acid from the DEAM-PS resin was studied by UV spectroscopy. Hydrolysis and attachment were shown to occur under a rapidly attained equilibrium, and a large excess of water (>32 equiv) is required to effect a practically quant. release of boronic acids from DEAM-PS. Despite their relative sensitivity to water and alcs., DEAM-PS-bound arylboronic acids functionalized with a formyl, a bromomethyl, a carboxyl, or an amino group can be transformed in good to excellent yields into a wide variety of amines, amides, anilides, and ureas, resp. Ugi multicomponent reactions on DEAM-PS-supported aminobenzeneboronic acids, derivatization of multifunctional arylboronic acids, and sequential reactions can also be carried out efficiently. These new DEAM-PS-supported arylboronic acids can be employed directly into resin-to-resin transfer reactions (RRTR). This type of multiresin process helps eliminate time-consuming cleavage and transfer operations, thereby considerably simplifying the outlook of combinatorial library synthesis by manual or automated means. This concept was illustrated by a set of optimized procedures for the Suzuki cross-coupling and the borono-Mannich reactions.

AB Glycine is one of the major inhibitory neurotransmitters in the spinal cord and brain stem of vertebrates. The inhibitory actions of glycine are mediated by the strychnine-sensitive glycine receptor , a ligand-gated chloride channel distributed throughout the spinal cord and brain stem. Glycine is also known to potentate the action of glutamate acting as an essential co-agonist on postsynaptic N-methyl-d- aspartate (NMDA) receptors. Synaptic levels of glycine are believed to be controlled by high-affinity glycine transporters. These transporters are members of a large family of sodium/chloride-dependent transporters, which are composed of single oligomeric proteins containing 12 hydrophobic membrane-spanning domains. There is evidence that glycine-mediated inhibition produces muscle relaxation and blockade of this inhibition produces convulsions. Therefore, we postulated that modulators of endogenous levels of glycine might provide skeletal muscle relaxation. A significant amount of data has accumulated over recent years, indicating that glycine also has an important role in the modulation of nociceptive pathways. Thus, it was anticipated that an increase in synaptic levels of endogenous glycine by a selective inhibition of the GlyT-2 transporter in the spinal cord may offer a unique approach for developing a novel muscle relaxant, anesthetic, and/or analgesic reagent, suitable for use during surgical anesthesia. Due to the discrete localization of both ssGlyR and the GlyT-2 transporter within the spinal cord and brain stem, a glycine modulator might not be expected to lead to serious CNS side effects that are characteristic for currently used μ-opioid analgesics. Since testing of this hypothesis has been hampered by the lack of a suitable GlyT-2 inhibitor, we sought a potent and selective inhibitor of the transporter that would enable us to conduct proof-of-principle studies. In summary, high-throughput screening of Organon's compound collection provided an attractive drug-like GlyT-2 inhibitor suitable for high-throughput synthesis. A detailed study of the SAR and rapid hit optimization were achieved through synthesis of a solution-phase 2D library. This led to identification of 4-benzyloxy-3,5-dimethoxy-N-[(1-dimethylaminocyclopentyl)methyl]benzamide, the first potent and selective GlyT-2 inhibitor.

AB Compds. of general formula [I; wherein Ar1 and Ar2 are each an optionally substituted aromatic group; P and Q are each a divalent aliphatic hydrocarbon group which may contain ethereal oxygen or sulfur in the carbon chain and may be substituted; R1 and R3 are each (i) hydrogen, (ii) acyl, or (iii) optionally substituted hydrocarbyl; R2 and R4 are each (i) hydrogen, (ii) optionally substituted alkyl, or (iii) optionally substituted alkylcarbonyl; alternatively R1 and R2 or R3 and R4 together with the nitrogen atom adjacent thereto may form a monocyclic or fused nitrogenous heterocyclic group; and j is 0 or 1], salts of the same, or prodrugs thereof are prepd. These compds. are useful for the treatment of diseases caused by MCH, e.g. obesity (as antiobesity agents) or overeating (as appetite depressants), or for the improvement of emotional disorders or sexual function. Thus, benzyl 2-[(5-hydroxy-2,2-diphenylpentyl)amino]-2-oxoethylcarbamate was brominated by Br and Ph3P in MeCN at room temp. for 1 h to give benzyl 2-[(5-bromo-2,2-diphenylpentyl)amino]-2-oxoethylcarbamate which was dissolved in MeCN, treated with 4-phenylpiperidine and K2CO3 in MeCN, and stirred at 40° overnight to give, after purifn. on alumina column chromatog. and conversion into the HCl, benzyl 2-[[2,2-diphenyl-5-(4-phenylpiperidino)pentyl]amino]-2-oxoethylcarbamate hydrochloride (II). II in vitro inhibited the binding of [35S]-guanosine 5'-(γ-thio)triphosphate to human somatostatin-like receptor (SLC-1) with IC50 of 5 nM. Tablet formulations contg. II were described. .

AB Title compds. (I) [wherein n = 2-4; V = O or S; W = O, S, or SO2; R1 = H, alkyl, Ph, or CF3; R2 = independently H, (cyclo)alkyl, cycloalkylalkyl, aryl(alkyl), or together with the Ph to which they are bound form naphthyl or 1,2,3,4-tetrahydronaphthyl; R3 = independently H, (cyclo)alkyl, cycloalkylalkyl, or aryl(alkyl); R4 = independently H, alkyl, aryl, or benzyl; R5 = independently H or (un)substituted (hetero)aryl, provided that at least one R5 = (un)substituted (hetero)aryl; and R6 = H or (amino)alkyl] were prepared as are modulators of peroxisome proliferator activated receptors (PPARs) and are useful in the treatment of type II diabetes and cardiovascular diseases. For example, a mixture of the toluene-4-sulfonic acid 2-(2-(biphenyl-4-yl)-5-methyloxazol-4-yl)ethyl ester and 2-(3-hydroxyphenoxy)-2-methylpropanoic acid Et ester was heated at 55°C in DMF for 18 h and the intermediate deesterified using NaOH in EtOH and THF to afford the title compound II. II bound to human PPARα and PPARγ with IC50 values of 97 nM and 532 nM, resp., and activated human PPARα and PPARγ with efficacies of 97% and 70%, resp. In assays evaluating triglyceride and cholesterol levels in mice transgenic for human apoAI, administration of II reduced triglyceride serum levels by 60.5% and increased HDLc serum levels by 204%. Glucose normalization of 95% was attained in male diabetic (db/db) mice dosed with II.

AB Human keratinocytes are fully competent cells of the vitamin D (VD) hormone system. They have the capacity to generate VD, to convert it to hormonally active 1α,25(OH)2D3 and subsequently, to metabolize the hormone by self-induced CYP24. These reactions generate a cascade of highly transient products and, eventually terminate biol. activity. To elucidate regulatory principles in the VD cascade in more detail, we made use of novel selective CYP24 inhibitors, recently synthesized by our group. Here, we describe the effects of VID 400 and SDZ 89-443 on the metabolism of 20 nM 3H-25(OH)D3 in human keratinocytes, analyzed by sensitive HPLC methods. First, we present evidence that freshly generated 1α,25(OH)2D3 does not down-regulate 1α-hydroxylation, as commonly assumed. The transient time course of 1α,25(OH)2D3, could be explained by its fast 24-hydroxylation to polar products, undetectable by usual HPLC-anal. of organic exts. On inhibition of CYP24, 1α-hydroxylation continued throughout extended periods, indicating its constitutive nature. Asking whether 1α,25(OH)2D3 derived metabolites [1α,25(OH)2-3epi-D3, 1α,24(R),25(OH)3D3, 1α,25(OH)2-24-oxo-D3, 1α,23(S),25(OH)3-24-oxo-D3 and calcitroic acid] would regulate 1α-hydroxylase, we pretreated cells with 20 nM of these metabolites for 5 h and 24 h. Subsequent incubation with 3H-25(OH)D3 demonstrated that neither metabolite substantially impaired 1α-hydroxylase, while all of them transiently induced CYP24 activity. Analyzing the effects of VID 400 on the kinetics of 3H-25(OH)D3, we showed that 1α-hydroxylation rather than 24-hydroxylation was rate-limiting in the C-24 oxidation pathway - again suggesting constitutive expression of 1α-hydroxylase. CYP24 inhibitors effectively increased the levels and lifetime of all transient 1α-hydroxylated metabolites, especially of 1α,25(OH)2-3epi-D3 that became the predominant lipid soluble metabolite. Highly increased levels of 1α,23(S),25(OH)3-24-oxo-D3, the metabolite preceding side chain cleavage, indicated involvement of CYP24 also in the terminal step of the cascade. Besides using inhibitors of CYP24 as tools to explore mechanisms in the VD cascade, they also appear to be valuable to discover the intrinsic biol. functions of distinct metabolites.

AB Human keratinocytes convert 25(OH)D3 to hormonally active 1α,25(OH)2D3 and respond to its anti-proliferative/pro-differentiating action in vitro and in vivo. Levels and activity of 1α,25(OH)2D3 are short-lived. The 1α,25(OH)2D3 induces 24-hydroxylase (CYP24) that rapidly metabolizes the hormone, yielding a cascade of side-chain oxidized products and this eventually results in the loss of activity. Aiming at stabilizing the levels of active hormone, we have searched for potent, selective inhibitors of CYP24. Selective inhibition was crucial in order to avoid impairment of 1α,25(OH)2D3 synthesis, catalyzed by 1α-hydroxylase, a related member of cytochrome P 450 (CYP) superfamily. We describe here the testing protocol, using primary human keratinocyte cultures as an appropriate source of CYP24 and 1α-hydroxylase, 3H-25(OH)D3 (at physiol. concns.) as substrate and sensitive HPLC techniques to analyze the complex metabolite profiles. Four hundred potential inhibitors were screened by this method; most of them were synthesized in our laboratory These compds. (entitled azoles) were capable of direct binding to the heme iron and of addnl. interactions with other parts of the enzyme. In this paper, we present VID400 and SDZ 89-443, as first examples of powerful selective CYP24 inhibitors. As anticipated, these compds. increased the levels of 1α-hydroxylated products generated from 3H-25(OH)D3 and extended their lifetime. Importantly, blocking of 24-hydroxylation led to a switch in metabolism, namely to preferential conversion of 1α,25(OH)2D3 to 1α,25(OH)2-3epi-D3. As spin-off from our program, selective inhibitors of 1α-hydroxylase were also found (e.g., SDZ 88-357). Using 3H-25(OH)D3 as substrate in the absence of SDZ 88-357, CYP24 showed high preference for freshly generated 1α-hydroxylated metabolites over abundant 25(OH)D3. In the presence of SDZ 88-357, we noticed a great increase in 24-hydroxylation of 3H-25(OH)D3. Besides their use as valuable tools in elucidating regulatory mechanisms, inhibitors of vitamin D hydroxylases may give rise to novel therapeutic strategies, especially in defects of cell growth and differentiation.

heterocyclic ring; E = NR5CO, NR5CONR6, SO2NR5, NR5SO2NR6, NR5SO2NR6CO; R5 and R6 = H, alkyl, alkenyl, alkynyl, (alkyl)cycloalkyl or (un)substituted alkylphenyl, alkylnaphthyl, alkylheteroaryl, carboxyalkyl, carbamidoalkyl, etc.; G = (un)substituted methylene, ethylene, or propylene; J = bond, CONR11, NR11CO, NR11, NR11CH2, O, S, SO2, SO, OCH2, or SO2CH2; R11 = H, alkyl, alkenyl, alkynyl, (alkyl)cycloalkyl or (un)substituted alkylphenyl, alkylnaphthyl, or alkylheteroaryl; Z = (un)substituted Ph, naphthyl, or heterocyclic ring; L = H, CN, CONR12NR13, (CH2)0-2NR12R13, C(:NR12)NR12R13, NR12R13, OR12, NR12C(:NR12)NR12N13, or NR12C(:N12)R13; R12 and R13 = independently H, OH, alkyl, (un)substituted alkoxy, (di)alkylamino, alkylphenyl, alkylnaphthyl, carboxyalkyl, etc.] were prepd. as potent and highly selective inhibitors of factor Xa for the prevention or treatment of coagulation disorders (no data). For example, N-tert-butoxycarbonylglycinol was condensed with 3-cyanophenol in the presence of PPh3 and DEAD in CH2Cl2 (93%), and the amine deprotected and converted to the salt using TFA. Reaction of the TFA amine salt with 2'-(tert-butylaminosulfonyl)-4-biphenylcarboxylic acid in the presence of BOP and i-Pr2NEt in DMF gave the amide (84%). The benzonitrile was converted to the desired benzamidine salt (I•TFA) in 85% yield by bubbling HCl gas through a soln. of the amide intermediate in MeOH, followed by neutralization and workup using 0.5% TFA in H2O/MeCN. Compds. of the invention show selectivity for factor Xa vs. other proteases of the coagulation cascade or the fibrinolytic cascade, and are useful as diagnostic reagents as well as antithrombotic agents (no data).

AB Involved in the coagulation cascade, factor Xa (FXa) is a serine protease which has received great interest as a potential target for the development of new antithrombotics. Although there is a great wealth of structural data on thrombin complexes, few structures of ligand/FXa complexes have been reported, presumably because of the difficulty in growing crystals. Reproducible crystallization conditions for human des-Gla1-45 coagulation FXa have been found. This has led to an improvement in the diffraction quality of the crystals (about 2.1 Å) when compared to the previously reported forms (2.3-2.8 Å) thus providing a suitable platform for a structure-based drug design approach. A series of crystal structures of noncovalent inhibitors complexed with FXa have been determined, three of which are presented herein. These include compds. containing the benzamidine moiety and surrogates of the basic group. The benzamidine-containing compound binds in a canonical fashion typical of synthetic serine protease inhibitors. On the contrary, mols. that contain surrogates of the benzamidine group do not make direct hydrogen-bonding interactions with the carboxylate of Asp189 at the bottom of the S1 pocket. The structural data provide a likely explanation for the specificity of these inhibitors and a great aid in the design of bioavailable potent FXa inhibitors.

AB The first resin-to-resin coupling reaction generating carbon-carbon bonds has been achieved by the palladium-catalyzed Suzuki coupling of di(ethanolamino)methylpolystyrene-bound arylboronic acids with resin-bound iodoarenes to give biaryl derivs. in 55-100% yields upon cleavage of the resin with trifluoroacetic acid in methylene chloride. E.g., resin-bound 3-aminobenzeneboronic acid was treated with 4-chlorobenzoyl chloride to give an resin-bound amide derivative; addition of 0.25 equivalent resin-bound 3-iodobenzylamine and stirring at 105° in DMF in the presence of tetrakis(triphenylphosphine)palladium (0), ethylene glycol, and triethylamine gave a resin-bound aminomethylbiaryl amide which was liberated from the resin with a 1:1 solution of trifluoroacetic acid in methylene chloride to give I in 100% yield. A library of six biaryl derivs. was prepared using the resin-to-resin Suzuki coupling procedure. The resin-to-resin Suzuki coupling procedure allows the preparation of unsym. biaryl derivs. that would be more difficult to prepare on a single solid phase.

AB Coagulation factor Xa is the sole enzyme responsible for activating the zymogen prothrombin to thrombin, resulting in fibrin generation, platelet activation, and subsequent thrombus formation. Our objective was to evaluate the antithrombotic efficacy of the novel factor Xa inhibitor, 2-(3-carbamimidoyl-benzyl)-3-[(3',4'dimethoxy-biphenyl-4-carbonyl)-amino]-butyric acid Me ester-trifluoroacetate (RPR208566), in a well-established rat model of arterial thrombosis, and to compare the results with those obtained with argatroban and heparin, direct and indirect inhibitors of thrombin, resp. Thrombus formation was initiated by placing a filter paper saturated with FeCl2 on the adventitia of the carotid artery for 10 min.

Time-to-occlusion was measured from initiation of injury until blood flow reached zero. Formed thrombi were removed and weighed 60 min after the placement of the filter paper. RPR208566, heparin, and argatroban dose-dependently increased time-to-occlusion and reduced thrombus mass. When administered at 500 μg/kg+50 μg/kg/min, RPR208566 prolonged time-to-occlusion to 56±4 min (vs. 18±2 min for vehicle) and reduced thrombus mass to 3.0±0.7 mg (vs. 7.3±0.6 mg for vehicle). The highest doses of argatroban (500 μg/kg+50 μg/kg/min) and heparin (300 U/kg+10 U/kg/min) increased time-to-occlusion to the maximum of 60 min and decreased thrombus mass to 5.5±0.8 and 2.6±0.3, resp. The antithrombotic effects of heparin and argatroban at these doses were associated with increases in activated partial thromboplastin time of 5.6±0.9- and 2.9±0.3-fold over baseline, resp. However, the highest dose of RPR208566 produced a modest 1.3±0.1-fold increase in activated partial thromboplastin time. These results indicate that factor Xa inhibition with compds. such as RPR208566 may be an attractive mechanism for novel antithrombotic drug therapy.

AB The synthesis and anal. of [14C]NVP VID400 (I), a specific vitamin D3-hydroxylase inhibitor, is reported. The key intermediate is (R)-2-amino-1-phenyl-[1-14C]ethanol, synthesized in an effective, enantioselective approach using a borane reduction of phenacyl chloride in the presence of a (R)-oxazaborolidine catalyst. The secondary isotope effect induced splitting of 13C-NMR signals enabled the quantification of the isotopic purity and thereby the specific activity of I.

AB The present invention relates to a pharmaceutical composition comprising as an active ingredient a compound of formula [I; wherein ring A is an aromatic or a heterocyclic ring; Q is a bond, carbonyl, lower alkylene optionally substituted by HO or Ph, lower alkenylene, or -O-(lower alkylene)-; n is 0, 1 or 2; Z is oxygen or sulfur; W is oxygen, sulfur, -CH:CH-, -NH- or -N:CH-; R1, R2 and R3 are the same or different and are hydrogen, halogen, hydroxyl, a substituted or unsubstituted lower alkyl group, a substituted or unsubstituted lower alkoxy group, a substituted or unsubstituted amino group, CO2H or an amide or an ester thereof, cyano, lower alkylthio, lower alkanesulfonyl, substituted or unsubstituted SO2NH2, etc.; R4 is tetrazolyl, carboxyl group, amide or ester; R5 is hydrogen, nitro, amino,

L4 ANSWER 116 OF 177 HCAPLUS COPYRIGHT 2006 ACS on STN (Continued)
hydroxyl, lower alkanoyl, lower alkyl, etc.; R6 is selected from (a) a substituted or unsubstituted Ph group, (b) a substituted or unsubstituted pyridyl group, (c) a substituted or unsubstituted thienyl group, (d) a substituted or unsubstituted benzofuranyl group, etc.; or a pharmaceutically acceptable salt thereof]. These phenylalanine derivs. are useful for treating or preventing conditions caused by α4-mediated cell adhesion such as rheumatoid arthritis, asthma, psoriasis, eczema, contact dermatitis and other skin inflammatory diseases, diabetes, multiple sclerosis, systemic lupus erythematosus (SLE), inflammatory bowel disease including ulcerative colitis and Crohn's disease, and other diseases involving leukocyte infiltration of the gastrointestinal tract, or other epithelial lined tissues, such as skin, urinary tract, respiratory airway, and joint synovium. N-(tert-butoxycarbonyl)-O-(trifluoromethanesulfonyl)-L-tyrosine Me ester (prepn. given) was coupled with 2-methoxybenzene boronic acid in toluene/DMF in the presence of K2CO3 and Pd(PPh3)4 at 80 °C for 24 h to give N-(tert-butoxycarbonyl)-4-(2-methoxyphenyl)-L-phenylalanine Me ester. The latter compd. was treated with CF3CO2H in CH2Cl2 for 1.5 h to remove the Boc group and then condensed with 2,6-dichlorobenzoyl chloride in the presence of diisopropylethylamine at room temp. for 24 h to give N-(2,6-dichlorobenzoyl)-4-(2-methoxyphenyl)-L-phenylalanine Me ester (II) which was sapond. with LiOH in THF/MeOH at room temp. for 3 h, evapd., treated with H2O, adjusted Ph 2, and extd. with EtOAc to give N-(2,6-dichlorobenzoyl)-4-(2-methoxyphenyl)-L-phenylalanine (III). II and III in vitro inhibited at IC50 of 1≥ and 0.3≥ μM, resp., β7-mediated cell adhesion which measured the adhesive interactions of a B-cell line, RPMI, known to express α4β7, to the alternatively spliced region of fibronectin referred to as CS-1, in the presence of test compds.

AB Three-dimensional models for the catalytic domain of gelatinases (MMP-9 and -2) have been constructed based on the X-ray crystal structure of MMP-3. Conformations of the loop segment which forms the bottom half of the S1' subsite but shows conformational diversity among the crystal structures of other MMPs have been explored by simulated annealing of each gelatinase model complexed with two highly potent "probe" inhibitors. Representative catalytic domain models have been selected for each gelatinase from the set of generated conformations based on shape complementarity of the loop to the probe inhibitors. The single model selected for MMP-9 was utilized to explain the structure-activity relationship of our novel sulfonamide inhibitors. Mol. dynamics (MD) simulations of the complex models revealed important features of the binding mechanism of our inhibitors: (i) the ligand carboxylate group coordinating to the catalytic zinc ion and hydrogen bonding to the Glu219 side chain, (ii) one of the sulfonyl oxygens forming hydrogen bonds with the main chain NHs (Leu181 and Ala182), (iii) the sulfonyl substituent making extensive hydrophobic contact with the S1' subsite. The gauche conformation exclusively adopted by the sulfonamide C-N-S-C torsion plays an important role in achieving the third binding feature by properly directing the substituent into the S1' subsite. Improvement of the inhibitory activity according to straight elongation of the sulfonyl substituent was attributed to an increase of the hydrophobic contact between the substituent and the S1' subsite. Structural modifications which alter the straight shape of the substituent lead to deterioration of the activity. On the other hand, the two candidate models selected for MMP-2 differ in the bottom shape of the S1' subsite: one with a channel-like subsite and the other with a pocket-like subsite resembling that of the MMP-9 model. The bottom shape was exptl. probed by chemical synthesis of inhibitors having elongated sulfonyl substituents whose terminal alkyl groups were shown by MD simulations to protrude from the S1' subsite bottom into the solvent. Gelatinase assays of these inhibitors showed that elongation of the substituent significantly reduces activity against MMP-9 while retaining activity against MMP-2, consequently increasing the selectivity between MMP-2 and -9. The results confirm that MMP-9 has a pocket-like S1' subsite with a floorboard and MMP-2 has a channel-like S1' subsite.

AB Title compds. I [R = H, OH, NH2; R1 = R2 = H; or R1R2 = :NR9; R3 = H, CO2R6, COR6, CON(R6)2, CH2OR7, CH2SR7; R4 = H, alkyl, alkyl-Q, thioheterocyclyl, (CH2CH2)nAr, (CH:CH)nAr, CH2Ar; R5 = alk(en/yn)yl, cycloalk(en)yl, heterocycl(en)yl, aryl, heteroaryl, fused systems, etc.; R6 = H, lower alkyl; R7 = H, lower alkyl, aralkyl, lower acyl, aroyl, heteroaroyl; R8 = H, lower alkyl; R9 = H, R10O2C, R10O, HO, cyano, R10CO, OHC, lower alkyl, O2N, Y1'Y2'N; R10 = alkyl, aralkyl, heteroaralkyl; Y1', Y2' = H, alkyl; Q = R7O, R7S, Y1Y2N; Y1, Y2 = H, alkyl, aryl, aralkyl; or one of Y1 and Y2 = acyl or aroyl and the other is as given; Ar = aryl or heteroaryl; n = 0-2] and their pharmaceutically acceptable salts, prodrugs, N-oxides, hydrates, and solvates, are useful as Factor Xa inhibitors. For example, 4-(pyridin-3-yl)benzoic acid was amidated with tert-Bu 3-aminopropionate-HCl via the acid chloride, and the resulting β-acylamino ester underwent a sequence of (1) α-alkylation with 5-iodo-2-[(2-methoxyethoxy)methoxy]benzyl bromide, (2) acidic deprotection of the MEM group, and conversion to the Me ester, (3) Pd-catalyzed cyanation of the iodide, and (4) Pinner reaction and ammonolysis of the nitrile, to give title compound II. Three example compds. showed Ki values of 19.0-94.0 nM in a Factor Xa assay, 46 nM to 1.72 μM in a trypsin assay, and 477 nM to 2.71 μM in a thrombin assay.

* STRUCTURE DIAGRAM TOO LARGE FOR DISPLAY - AVAILABLE VIA OFFLINE PRINT *

AB The invention relates to new echinocandide derivs. I [R1 = H, acyl; R2 = H, OH; R3 = H, Me; R4 = H, OH; with the proviso that when R4 = OH, R2 = OH] or a salt thereof which have antimicrobial activities (especially antifungal activities), inhibitory activity on β-1,3-glucan synthase, to process for preparation thereof, to a pharmaceutical composition comprising the same, and to a method for the prophylactic and/or therapeutic treatment of infectious diseases including Pneumocystis carinii infection (e.g. Pneumocystis carinii pneumonia) in a human being or an animal. Thus, echinocandin derivative II [R = CO(CH2)14Me] (WF 738B), isolated from a culture of Coleophoma carterformis Number 738, was deacylated by treatment with washed mycelium of Actinoplanes utahensis IFO-13244 to give deacyl derivative II (R = H). Acylation of II (R = H) with a variety of activated benzoic acid derivs. gave modified title compds., e.g. II [R = 4-COC6H4-X-C6H4O(CH2)nMe-4; X = bond, 1,4-piperazinediyl, 3,5-isoxazoldiyl, 1,3,4-thiadiazol-2,5-diyl, thiazol-5,2-diyl, thiazol-2,5-diyl; n = 2,4,5,7].

AB The invention relates to novel 4-substituted quinoline derivs. I, their

L4 ANSWER 123 OF 177 HCAPLUS COPYRIGHT 2006 ACS on STN (Continued)
salts, and combinatorial libraries contg. mixts. of two or more such compds. [wherein R1 = bond, (un)substituted alk(en/yn)ylene, cycloalk(en)ylene, phenylene, naphthylene, heterocycle, heteroaryl, amino, CH2CONH, (CH2)pAr(CH2)q, etc.; p, q = 0-6 but both cannot be 0; Ar = (un)substituted Ph or heteroaryl; R2, R3, R4 = H, halo, (un)protected OH, cyano, NO2, (un)substituted alk(en/yn)yl, alkoxy, cycloalk(en)yl, heterocyclyl, phenylalkyl, Ph, naphthyl, etc.; R5 = H, (un)substituted alk(en/yn)yl, cycloalk(en)yl, Ph, naphthyl, phenylalkyl, (un)protected CO2H, acyl, heterocyclyl, etc.; R6 = H, (un)substituted Ph, naphthyl, 2-oxopyrrolidin-1-yl and higher homologs, (un)substituted NHCHO; R7 = H, (un)substituted alkyl; Y = CO2H, OH, SH, NHR8, CONHR8, CH2OH, CH2NH2, CH2NHR8; R8 = H, (un)substituted alkyl, or functionalized resin; R9 = H, (un)substituted alkyl, phenylalkyl, acyl, PhSO2, alkylsulfonyl, alkylaminocarbonyl, or PhNHCO, or is absent; dotted lines = optional pi bonds]. The invention also relates to the generation of such libraries. In 12 examples, libraries of I ranging in size from 2380 to 39,440 compds. were prepd. as mixed sublibraries. Data for control compds. (samples of individually known intermediates and products, cleaved from simultaneously processed control resins) are given for some examples. Both quinoline and tetrahydroquinoline libraries were prepd. For instance, tea-bags of MBHA resin were each coupled with L- or D-N-BOC-p-nitrophenylalanine, the BOC groups were removed from both, and the amino groups were each acylated with 170 carboxylic acids. The acylated, resin-bound products were mixed and reduced at the nitro group, and the amine product mixts. were condensed with 58 different aldehydes and cyclized with 4-methoxystyrene. Cleavage of the resin-bound products with HF gave mixed sublibraries of I. Individual control samples of products, such as II [R5 = 1-naphthyl, 2,3-difluorophenyl, cyclohexyl, etc.], were obtained by reactions of pure, resin-bound L-N-propanoyl-p-aminophenylalanine control samples with individual aldehydes and 4-methoxystyrene. Potential applications of I (no data) may include use as antibacterials, NMDA antagonists, or analgesics.

AB The invention relates to novel tricyclic tetrahydroquinoline compds. I, their salts, and combinatorial libraries containing mixts. of two or more such compds. [wherein R1 = bond, (un)substituted alk(en/yn)ylene, cycloalk(en)ylene, phenylene, naphthylene, heterocycle, heteroaryl, amino, CH2CONH, (CH2)pAr(CH2)q; p, q = 0-6 but both cannot be 0; Ar = (un)substituted Ph or heteroaryl; R2, R3, R4 = H, halo, (un)protected OH, cyano, NO2, (un)substituted alk(en/yn)yl, alkoxy, cycloalk(en)yl, heterocyclyl, phenylalkyl, Ph, naphthyl, etc.; R5 = H, (un)substituted alk(en/yn)yl, cycloalk(en)yl, Ph, naphthyl, phenylalkyl, (un)protected CO2H, acyl, heterocyclyl, etc.; R6 = H, (un)substituted alkyl, phenylalkyl, acyl, PhSO2, alkylsulfonyl, alkylaminocarbonyl, PhNHCO; n = 1-3; Y = CO2H, OH, SH, NHR7, CONHR7, CH2OH, CH2NH2, CH2NHR7; R7 = H,

L4 ANSWER 124 OF 177 HCAPLUS COPYRIGHT 2006 ACS on STN (Continued)
(un)substituted alkyl, or functionalized resin; R1 must be present and R5 ≠ Ph when Y = CO2H]. The invention also relates to the generation of such libraries. In 2 examples, libraries of 2774 and approx. 17,000 compds. I were prepd. as mixed sublibraries. Data for control compds. (samples of individually known intermediates and products, cleaved from simultaneously processed control resins) are given. For instance, tea-bags of MBHA resin were each coupled with one of 19 aminobenzoic acids, such as 4-aminobenzoic acid. Diagnostic cleavage of each of these resins with HF gave 19 aminobenzamide controls in 34-99% yield. The 19 resins were mixed together and placed in new tea-bags, then condensed with 73 different aldehydes, and finally cyclized with cyclopentadiene. Cleavage of the resin-bound products with HF gave mixed approx. 73 mixts. of 38 compds. (counting sep. enantiomers). Individual control samples of products, such as II [R5 = H, CH2Cl, cyclohexyl, CO2H, (un)substituted Ph, etc.], were typically obtained in 50-100% yield by reactions of pure, resin-bound 4-aminobenzoic acid control samples in sibling tea-bags. Potential applications of I (no data) may include use as antibacterials or analgesics.

AB Bis(5(4H)oxazolinones) derived from naturally occurring α-amino acids were reacted with amine-terminated polyethers and polyamides in the bulk at 175-200°. Model reactions were also carried out using primary alkylamines. The reactions were studied by SEC, and 1H and 13C NMR, and the resulting polymers were characterized by DSC and TGA. The chain-coupling reaction is extremely fast and yields high-molar-mass copolymers containing peptide linkages in less than 5 min. The NMR spectra of model compds. and polymers were fully assigned, showing that the oxazolinone/amine polyaddn. reaction proceeds in the expected way, without any noticeable side reaction. The polymers exhibit lower crystallinity, higher Tg, and a melting temperature close to or lower than that of the starting oligomers.

AB A series of 92 azole antifungals containing an amido alc. unit was synthesized. The nature and substitution of the amide portion was systematically modified in search of improved antifungal activity, especially against filamentous fungi. The compds. were tested in vitro against a variety of clin. important pathogens and in vivo (po) in a murine candidosis model. Thiazole and thiophene carboxamides carrying both a substituted Ph ring and a small alkyl group were best suited for activity against filamentous fungi. In a subset of these compds., the amide portion was conformationally locked by means of a pyrimidone ring and it was proven that only an orthogonal orientation of the Ph ring yields bioactive products. A tendency to display long plasma elimination half-lives was observed in both series. Two compds., I and 107, representative of the open and cyclic amides, resp., were chosen for further studies. Both candidates showed excellent activity in in vivo murine models of candidosis and aspergillosis, but their long elimination rates and high toxicities were still unsatisfactory. This work describes

L4 ANSWER 127 OF 177 HCAPLUS COPYRIGHT 2006 ACS on STN (Continued)
the SARs found within this series. The next paper displays the results obtained in a related series of compds., the quinazolinones.

AB Various N-sulfonylamino acid derivs., e.g. I (R1 = PhCH2, X = bond, Y = SO2, CO, Z = CONHOH, CO2H; R1 = indol-3-ylmethyl, X = bond, Y = SO2, Z = CONHOH, CO2H; R1 = Me2CH, X = O, Y = SO2, Z = CONHOH, CO2H) and II (R2 = indol-3-ylmethyl, R5 = H, OMe-4, OMe-3, A = CH:CH, X = bond; R2 = indol-3-ylmethyl, R5 = Me-4, A = S, X = bond; R2 = CHMe2, R5 = OMe-4, SMe-4, A = CH:CH, X = bond; R2 = CHMe2, R5 = OMe-4, A = S, X = bond; R2 = indol-3-ylmethyl, R5 = H, Me-4, CO2H-4, A = CH:CH, X = C.tplbond.C; R2 = indol-3-ylmethyl, R5 = NO2-2, NO2-4, Me-4, A = S, X = C.tplbond.C; R2 = CHMe2, R5 = Me-4, A = CH:CH, S, X = C.tplbond.C; R2 = CH2Ph, R5 = OMe-4, A = CH:CH, S, X = C.tplbond.C), were synthesized and evaluated for their in vitro and in vivo activities to inhibit type IV collagenase (MMP-9 and MMP-2). When the amino acid residue and the sulfonamide moiety were modified, their inhibitory activities were greatly affected by the structure of the sulfonamide moiety. A series of aryl sulfonamide derivs. containing biaryl, tetrazole, amide, and triple bond were found to be potent and highly selective inhibitors of MMP-9 and MMP-2. In addition, these compds. were orally active in animal models of tumor growth and metastasis. These results revealed the potential of the N-sulfonylamino acid derivs. as a new type of candidate drug for the treatment of cancer.

AB The discovery and some of the basic structure-activity relationships of a series of novel nonpeptide inhibitors of blood coagulation Factor Xa is described. These inhibitors are functionalized β-alanines, exemplified by benzoylstyryl-β-alanine Me ester (I). Docking expts. placing I in the active site of factor Xa implied that the most expeditious route to enhancing in vitro potency was to modify the group occupying the S3 site of the enzyme. Increasing the hydrophobic contacts between the inhibitor and the enzyme in this region led to phenylbenzoyl-β-alanine Me ester, which has served as the prototype for this series. In addition, an enantioselective synthesis of these substituted β-alanines was also developed.

AB A peptide-based structure-activity study is reported leading to the discovery of novel potent thrombin receptor antagonists. Systematic substitution of nonproteogenic amino acids for the 2nd and 3rd residues of the human thrombin receptor tethered ligand sequence (SFLLR) led to a series of agonists with enhanced potency. The most potent pentapeptide agonist identified was Ser-p-fluoroPhe-p-guanidinoPhe-Leu-Arg-NH2 (I) (EC50 .apprx.0.04 μM for stimulation of human platelet aggregation, .apprx.10-fold more potent than the natural pentapeptide). Systematic substitution of the NH2-terminal Ser in I with neutral hydrophobic NH2-acyl groups led to partial agonists and eventually antagonists with unprecedented potency (>1000-fold increase over the previously reported antagonist 3-mercaptopropionyl-Phe-Cha-Cha-Arg-Lys-Pro-Asn-Asp-Lys-NH2). In the series of NH2-acyl tetrapeptide antagonists, N-trans-cinnamoyl-p-fluoroPhe-p-guanidinoPhe-Leu-Arg-NH2 (II) was identified as the tightest binding (IC50 .apprx.8 nM) and most potent with an IC50 .apprx.0.20 μM for inhibition of SFLLRNP-NH2-stimulated platelet aggregation. Systematic single substitutions in (II) indicated that, in addition to the NH2-terminal acyl group, the side chains at the 2nd and 3rd positions were also responsible for important and specific receptor interactions. The p-fluoroPhe and p-guanidinoPhe residues in the 2nd and 3rd positions of II were observed to be optimal in both the agonist and antagonist series. In the case of antagonists, however, an appropriately positioned pos. charged group (i.e., protonated base) at the 3rd residue was required. In contrast, such a substitution was not required for potent agonist activity. An even more potent antagonist resulted when II was extended at the C-terminus by a single Arg residue giving rise to analog BMS-200261 (III) which had an IC50 .apprx.20 nM for inhibition of SFLLRNP-NH2-stimulated platelet aggregation. When the C-terminal Arg of III was replaced by an Orn(N5-propionyl) residue, the resulting antagonist (BMS-200661) was suitable for use in radioligand binding assays (Kd = 10-30 nM). Antagonist activity observed for selected compds. was verified through secondary assays in that these analogs prevented SFLLRNP-NH2-stimulated GTPase activity in platelet membranes and Ca2+ mobilization in cultured human smooth muscle cells and mouse fibroblasts. Furthermore, this inhibition occurred at concns. that had no effect on thrombin catalytic activity, indicating a specific activity attributable to receptor binding and not enzyme inhibition.

AB Modified amino acid compds. as absorption enhancers are useful in the delivery of active agents. These compound are used as carriers to facilitate the delivery of a cargo to a target. Thus, 47.00 g acetylsalicyloyl chloride was added to a mixture of 50.00 g 4-(4-aminophenyl)butyric acid in 300 mL of 2M aqueous sodium hydroxide and the reaction was stirred at 25° for 2 h, then it was acidified with aqueous HCl to obtain a precipitate which was separated and washed to give 31.89 g 4-(2-hydroxyphenylcarbonylamino)p-phenylbutanoic acid (I). I was mixed with interferon α-2 (II) in Tris-HCl buffer pH = 7-8 and was orally administered to rats at a rate of 300 mg I/kg and 1000 μg II/kg. The mean peak serum level of II was 8213 as compared to 688 ng/mL for controls.

AB Ring opening of aziridines 4a-d in reactions with trityl anion Tr- proceeds exclusively by cleavage of the NCMe2 bond. Substitution of the benzylic carbon of Tr- leads to 'central' products TrCMe2CH2NHCOR in yields of 0-5%. This is ascribed to an SN2 reaction with borderline character, as is well known from reactions of aziridines 4a-d with other nucleophiles. All remaining ring-opening reactions result from single-electron transfer (SET). This is direct SET from Tr- to aziridines 4a-c. For compound 4d (acyl = cinnamoyl), the SEt reaction is of the inner-sphere type and proceeds via Michael addition, at least in part. Homolytic ring opening of the generated aziridino ketyls I forms the tertiary amidatoalkyl radicals II. Main reaction of radicals II is transfer of a hydrogen atom from one of its two Me groups to the generated trityl radical Tr.. Methallylamides and enamides are the final products.

L4 ANSWER 139 OF 177 HCAPLUS COPYRIGHT 2006 ACS on STN (Continued)
Ortho-Substituted triphenylmethanes 12 and/or its olefinic precursors III arise in .apprx.20% yield. A mechanism for the formation of these unique products is proposed that first converts the radicals II into the corresponding carbanions IV which undergo an SN2' reaction with one allylic system TrCHCH:CH' of the dimer V of Tr.. The leaving group Tr- is eliminated from this partial structure when carbanions IV attack the marked carbon converting it finally into the substituted ortho carbon of compds. 12. Addn. of radicals 6 to Tr- is probably the way to the para-substituted triphenylmethanes VI, which arise in yields of only 0-1% from aziridines 4a,b (acyl = benzoyl, pivaloyl). Higher yields of para-substituted compds. VI are obtained from aziridines 4c (acyl = 4-phenylbenzoyl) and 4d. This is ascribed, at least for substrate 4c, to a chain reaction because ketyl I from 4c must be formed more rapidly than ketyls I from 4a,b. A substantial part of radical II from 4d cyclizes, ending up as the triphenylmethane compd. VII that carries a pyrrolidone ring in the para position.

AB The calcium dependent E-selectin/sialyl Lewisx (sLex) interaction plays a key role in inflammation where it mediates the rolling of leukocytes prior to firm adhesion and extravasation from the vasculature. A model of E-selectin/sLex binding, along with previously reported structure-activity relationships of sLex-related oligosaccharide, was used in the rational design of non-oligosaccharide inhibitors of this pivotal interaction. A palladium-mediated biaryl-coupling (Suzuki) reaction was used as the key step to prepare a number of substituted biphenyls which were assayed for their ability to inhibit the binding of E-, P-, and L-selectin-IgG fusion proteins to sLex expressed on the surface of HL60 cells. Some of the compds., e.g. I, developed had greater in vitro potency than the parent sLex tetrasaccharide and are currently being evaluated in in vivo models of inflammation to select a candidate for clin. development.

AB The regioselectivity ratio RS = normal:abnormal opening of activated 2-methylaziridines I (R = acyl, tosyl, H, Ph, etc.) by nucleophiles is found to range from 0.10 to unmeasurable large (only normal opening = substitution at CH2 by strongly basic carbanions). RS is assumed to result from SN2 variants differing in the degree to which bond breaking is ahead of bond making including perhaps synchronous SN2. Bond breaking will be more ahead for the N-CMe bond. High nucleophilic power pushes bond making toward a synchronous process resulting in great RS. The decrease in RS with acyl activation relative to sulfonyl activation is in accord with a flattening of the nitrogen pyramid (planarization effect). The planarization effect is retained in acidic medium by O-protonation: RS 0.10-0.14 for methanolysis as compared to RS 0.43 for N-protonated sulfonylaziridine I (R = tosyl). AM1 calcns. support the planarization hypothesis. No indication for SET with trityl anion was found.

AB The title compds. I [m = 1-3; Ar, Ar' = thienyl, (substituted) Ph, etc.; X = H; X' = H, OH; or XX' = oxo, dialkylaminoalkyloxyimino, etc.; Y = N, CX''; X'' = H or X'X'' = carbon-carbon bond; Q = H, alkyl, (CH2)qAm'; q = 2 or 3; Am' = piperidino, 4-benzylpiperidino, etc.; R = H, Me, (CH2)nL; n = 2-6; L = H, amino; T = CO, C(W)NH; W = O, S; Z = H, M, or OM when T = CO; or Z = M when T = C(W)NH; M = H, alkyl, (substituted) phenylalkyl, etc.] were prepared. I are neurokinin and substance P antagonists (no data). Reaction of amine II (Z1 = H) with 2,4-dichlorobenzoyl chloride in the presence of Et3N gave II (Z1 = 2,4-dichlorobenzoyl) isolated as its HCl salt. I are also useful as allergy and inflammation inhibitors (no data).

AB Alkyl N-hydroxylamines and alkylamines were prepared by the reduction of nitroalkanes with SmI2 in the presence of MeOH as proton source. Thus, treatment of 2-(3-methyl-3-nitro-2-phenylbutyl)dioxolane (I) with 4 equiv SmI2 gave 88% 2-[3-(N-hydroxyamino)-3-methyl-2-phenylbutyl]dioxolane; treatment of I with 6 equiv SmI2 gave 2-(3-amino-3-methyl-2-phenylbutyl)dioxolane which was treated with 4-PhC6H4COCl to give the corresponding amide. SmI2 was prepared by treating Sm with ICH2CH2I in THF.

AB Synthetic haptens are prepared and used to stimulate production of catalytic antibodies. The haptenes are designed such that the corresponding antibodies will selectively stabilize ≥1 of the high energy intermediates or transition states in the cleavage or formation of an amide, ester, or glycosidic bond. There are 3 classes of haptens: (1) those in which the hybridization of the atom corresponding to the carbonyl atom of the scissile bond of the amide or ester is converted from sp2 to sp3 hybridization; (2) those in which any of the atoms is replaced by a different atom, e.g. C may be replaced with P, S, Si, or B; and (3) those in which the atoms are part of a mono- or bicyclic system. Antibody-producing cells elicited by these haptens are used to prepare monoclonal antibodies and these are screened for catalytic activity. Cyclic peptide I, containing a difluoroketone transition state analog, was synthesized. The natural analog of this peptide includes residues 85 and 86 of the "flap" region of human renin. Cleavage of this bond disrupts binding of substrate to the catalytic site. The hapten was conjugated to keyhole limpet hemocyanin using glutaraldehyde and used to prepare monoclonal antibodies using standard procedures. These antibodies were found
to inhibit renin activity in human plasma.

AB Enantiomeric amide derivs. of (S)- and (R)-1-phenyl-2-aminopropanes were resolved by high performance liquid chromatog. on com. available ionically and covalently bonded chiral stationary phases [(R)-N-(3,5-dinitrobenzoyl)phenylglycine]. In 10 enantiomeric amide pairs, the (R)-isomer of all 10 amides was eluted first on the covalent column; the (R)-isomer of 9 derivs. was eluted first on the ionic column. However, the 3,5-dinitrobenzoyl amide of (S)-amphetamine eluted before the (R)-isomer on the ionic column. This reversal emphasizes the hazards of relying on observed elution order as an a priori indication of absolute configuration.

AB The reversed-phase liquid-chromatog. retention of 16 N-ethylbenzamides substituted with Me, methoxy or Ph groups at the 4-Ph position and/or at the 2-Et position was studied using 2 different octadecyl-phase columns and a Ph-phase column with H2O-MeOH solvent mixts. For isomeric amides, increased retention was observed for the isomer with the larger substituent at the 4-Ph position. Satisfactory linear correlations were obtained by plotting log k' (log capacity factor) obtained on 1 column vs. that on a 2nd column at the same or different eluent compns. Thus, quant. structure-retention relationships can be transformed from 1 reversed-phase system to another. The mol. connectivity indexes, χ, to 3rd order were calculated for the amides, and a high degree of correlation was observed between them and the measured log k'.

AB Aromatic-aliphatic dinitriles NCCMe2CH2ArCH2CMe2CN (where Ar is arylene or substituted arylene) were prepared and hydrolyzed to the corresponding diamines which were copolymd. with dicarboxylic acid derivs. to form thermally-stable, rigid, polyamide films and fibers. Thus, treatment of α,α'-dibromo-p-xylene [623-24-5] with Li+(Me2CCN)- (formed in situ from diisopropylamine [108-18-9], BuLi, and isobutyronitrile [78-82-0]) gave NCCMe2CH2C6H4-p-CH2CMe2CN [69774-41-0] which was converted to the resp. diamine (I) [69761-28-0] by treatment with (iso-Bu)2AlH followed by hydrolysis. Polycondensation of I with sebacoyl chloride gave a polyamide (II) [69761-71-3] of inherent viscosity 1.32 (0.05% in m-cresol at 25°) and which was formed into a clear, tough, colorless film at 180°/500 psi; alternatively, II was spun into a fiber which, after cold drawing, had strength of .apprx.1.5 g/denier.

AB The dihydroisoquinoline I (R = p-PhC6H4, 1-adamantyl, p-MeSO2NHC6H4CH2, p-H2NC6H4CH2, etc.; R1 = H, Me) were prepared by cyclization of amides. Thus, p-PhC6H4COCl was treated with 3,4-(MeO)2C6H3CH2CH2NH2 to give 3,4-(MeO)2C6H3CH2CH2NHCOC6H4Cl-p, which was cyclized with POCl3 to give I (R = p-PhC16H4, R1 = Me). Several I were reduced to the 1,2,3,4-tetrahydro derivs. I were hypotensives, depressants, and anticonvulsants (no data).

AB The amides I were subjected to an intramolecular ring closure and the resulting bisisoquinolines II were, if necessary, reduced to give the bisisoquinolines III (R1, R2 = alkoxy or R1R2 = OCH2O; A = IV, V, VI, or VII). II and III are remedies for thrombosis. E.g., 1 g I (R1 = R2 = OMe, A = IV) prepared from 3,4-dimethoxyphenethylamine and terephthaloyl dichloride was heated at 120° with POCl3 and pyridine to give 90% corresponding II.2HCl, which (10.6 g) was reduced with H using PtO2 as a catalyst to give 3.6 g meso-III.2HCl and 4.2 g racemic III.2HCl. Similarly prepared were the following II and III or salts thereof (R1, R2, and A given): OEt, OEt, IV; R1R2 = -OCH2O-, IV; OMe, OMe, VI; OMe, OMe, V; OMe, OMe, VII.

AB Pyridine was slowly added to a mixture of PhCOCHPhNH2.HCl (I) and the acid chloride II (n = 0-3) in C6H6 to give .apprx.80% amide III. This on boiling in AcOH containing a large excess of NH4OAc (or if n = 3 at 220° in NH4OH) gave .apprx.90% title imidazole (IV). Similarly, I and 1,3,5-(ClCO)3C6H3 gave 1,3,5-tris(diphenylimidazol-2-yl-benzene.

AB The most potent antifertility agent in a series of 64 tetrahydroisoquinolines synthesized was (+-,+-)-1-[4-[2-(1-pyrrolidinyl)ethoxy]phenyl]-2-(2-phenylpropyl)-1,2,3,4-tetrahydroisoquinoline-2HCl (I-2HCl) [36149-03-8], which was >5 times as potent as estrone in rats. I was also 1 of only 4 compds. in the series with diminished hormonal side effects. To synthesize I, p-methoxyphenylacetyl chloride was coupled with phenethylamine and the product cyclized with polyphosphoric acid to the dihydroisoquinoline, which was reduced with NaBH4 to the tetrahydroisoquinoline. The N-aralkyl group was attached by standard methods. The OMe was then converted to OH and
coupled with 1-chloro-2-(1-pyrrolidyl)ethane to yield I.

AB cf. CA 57, 2205f. Friedel-Crafts condensation of the azlactone (I) of κ-PhC6H4CONHCH2CO2H (II) with aromatic hydrocarbons, ArH, gave high yields of ketones, κ-PhC6H4CONHCH2COAr (III), dehydrated to 2-(ρ-biphenylyl)-5-aryloxazoles (IV). Treatment of AcCl with Ph2 in the presence of AlCl3 in CS2 yielded 61% κ-AcC6H4Ph, oxidized by NaOBr in aqueous dioxane to yield 95% κ-PhC6H4CO2H, m. 218°. Treatment of the acid with SOCl2 and dilution with ligroine yielded 84% κ-PhC6H4COCl, m. 109°. H2NCH2CO2H (40 g.) and 11 g. NaOH in 400 ml. 1:1 H2O-dioxane stirred at 0° (external cooling) with gradual addition of 11 g. NaOH in 100 ml. H2O and 54 g. κ-PhC6H4COCl in 400 ml. dioxane and the mixture stirred 1 hr., the clear solution made strongly acid with HCl, and the H2O-washed product (60 g.) recrystd. from alc. gave II, m. 219°; amide m. 185-6° (H2O). II (51 g.) heated 15 min. at 100° in 250 g. Ac2O and the cooled product washed thoroughly with Et2O yielded 39 g. I, m. 164° (ligroine). ArH and solvent [(ClCH2)2 except for C6H6. PhMe, and m-Me2C6H4] stirred with powdered AlCl3 at 0° (ice bath) with gradual addition of I, the mixture stirred 2 hrs., kept 16 hrs. at 20°, hydrolyzed with ice and HCl, filtered (with addition of Et2O if necessary), and the product washed with Et2O gave III [Ar, m.p. (solvent), and % yield]: Ph, 176-7° (alc.), 95; κ-MeC6H4, 186° (alc.), 96; 2,4-Me2C6H3, 165° (alc.), 98; α-C10H7, 199-200° (alc.), 50; 4-acenaphthyl, 189° (alc.), 92; 4-PhC6H4, 259° (CHCl3-alc.), 91; 4-cyclohexylphenyl, 213-14° (alc.), 53; 2-fluorenyl, 235-6° (CHCl3-alc.), 100; 3-phenanthryl, 232° (CHCl3-alc.), 40. III heated 2 hrs. on a boiling H2O bath with 8 parts POCl3 and the hydrolyzed material filtered gave 90-98% IV [Ar and m.p. (solvent) given]: Ph, 110° (alc.); κ-MeC6H4, 153-4° (alc.); 2,4-Me2C6H3, 123-4° (alc.); α-C10H7, 159-60° (alc.); 4-acenaphthyl, 165-7° (alc.); 4-PhC6H4, 232-3° (CHCl3-alc.); 4-cyclohexylphenyl, 133° (alc.); 2-fluorenyl, 229-30° (alc.); 3-phenanthryl, 171° (alc.). The ultraviolet spectra of IV were determined in cyclohexane and the maximum (absorption bands C, B, A) tabulated in comparison with similar data for 2-phenyl- and 2-(1-naphthyl)-5-aryloxazoles (V, VI). The tabulation permitted division of the maximum for IV into 3 groups, Ar being κ-MeC6H4, 2,4-Me2C6H3 cyclohexylphenyl; 1-C10H74-acenaphthyl, 3-phenanthryl; and 4-PhC6H4, 2-fluorenyl, designated Π, Π, N, and B groups, resp. The 9 spectral types (3 each for IV, V, VI) were reduced to 6 types by taking into account the similarity between oxazoles in which no distinction is made between the 2- and 5-positions and the fact that the letters Π, N, and B indicate not only Ph, 1-C10H7, and 4-PhC6H4, but also the other

L4 ANSWER 174 OF 177 HCAPLUS COPYRIGHT 2006 ACS on STN (Continued)
compds. pertaining to the same group. The av. values of λ and ε for the 6 types ΠΠΩ, ΠΒΩ, ΒΒΩ, ΝΠΩ, ΝΒΩ, ΝΝΩ (Ω stands for oxazole) are tabulated [type, λ, in mμ for bands C, B, A (ε + 10-4), calcd. λ in mμ for A given]: PPO, 225, 255, 305 (2.2, -- 3.2), 281; ΠΒΩ, 220, 265, 325 (1.5, 1.1, 4.0), 319; ΒΒΩ, 230, 280,330 (1.8, 1.4, 4.5), 330; ΝΠΩ, 240, 280, 335 (3.8, 1.7, 2.8), 335; ΝΒΩ, 245, 295,340 (3.0, 2.0, 3.5), 344; ΝΝΩ, 240, 300, 345 (5.4, --, 2.5), 361. Considering the sequences ΠΠΩ-ΠΞΩ-ΞΞΩ, ΠΒΩΞΒΩ, and ΝΠΩ-ΝΞΩ (Ξ = N or Π) it was shown that on replacing Ph by 4-PhC6H4, bands A and B underwent bathochromic and hyperchromic effects and band C a pronounced hypochromic effect, whereas replacement of Ph by 1-C10H7 caused a bathochromic and hypochromic effect on band A, a large bathochromic and hypochromic effect on band B, and a very large hyperchromic effect on band C. Calcn. according to Dewar (CA 47, 1489c) using the relation λ = 225/Σc1c2 (where 225 reflects the larger polarization of the 2,5-disubstituted oxazole nucleus relative to π-diarylbenzene, λ = 208/Σc1c2) gave the tabulated, calcd. values.

AB A number of previously unreported 2,5-diaryloxazoles (I) and 2,5-diaryl-1,3,4-oxadiazoles (II) have been prepared by the cyclization of the corresponding 1,4-diaryl-2-aza-1,4-diketones (III) and 1,2-diaroylhydrazines. p-C6H4(COCl)2 (25.0 g.) in 300 cc. dry pyridine treated slowly with 43.0 g. phenacylammonium chloride, the mixture refluxed 15 min., and the crude product filtered, dried, and recrystd. from about 2 l. pyridine gave 28.5 g. p-C6H4(CONHCH2Bz)2 (IV), m. 262-8°. IV (13.5 g.) in 500 cc. POCl3 refluxed overnight, most of the POCl3 distilled off, the residue added slowly to H2O, and the precipitate filtered, washed with H2O, dried, and recrystd. from pyridine yielded 10.3 g. 1,4-bis[2-(5-phenyl-2-oxazolyl)]benzene, m. 237-8°. Similarly was prepared 1,4-bis[5-(4-biphenylyl)-2-oxazolyl]benzene, m. 292-4°, from the corresponding III, m. 250°. BzNHNH2 (10 g.) added with stirring to 16 g. p-PhC6H4COCl in 100 cc. dry pyridine, the mixture refluxed 20 min., cooled, and diluted with H2O, and the precipitate dried and recrystd. from PhMe yielded 13.3 g. p-PhC6H4CONHNHBz (V), m. 222-4°. V (76 g.) in 200 POCl3 gently refluxed overnight yielded in the usual manner 52.0 g. 2-phenyl-5-(4-biphenylyl)-1,3,4-oxadiazole, m. 166-7°. By these methods were prepared the following 2-aryl-5-phenyloxazoles (aryl group, m.p. of I, and m.p. of III given): o-FC6H4, 84-5°, 116-17°; m-FC6H4, 69-70°, 128-9°; p-FC6H4, 81-2°, 134-5°; p-ClC6H4, 115-16°, 148-8.5°; 2,4-Cl2C6H3, 116-16.5°, 122.5-23°; 3,4-Cl2C6H3, 124.5-25°, 146.5-47°; o-BrC6H4, 71-2°, 115.5-16.5°; m-BrC6H4, 86-7°, 129-30°; p-BrC6H4, 115-16°, 164-5°; o-IC6H4, 78.5-9.5°, 111.5-12.4°; m-IC6H4, 112-13°, 146-7°; p-IC6H4, 130-1°, 163-5°, o-MeOC6H4, 145-6°, 102-3°; m-MeOC6H4, 79-80°, 80-1°; cyclohexyl, 87°, 113-14°; 2-C10H7, 110-11°, 148°; p-PhC6H4, 112-13°, 181-2°; 2-thenyl, 67-8°, 140-1°; 2-furyl, 68-9°, 138°; 2-(5-phenyloxazolyl), 242-3°, 198-200°. The following 2,5-diaryl-1,3,4-oxadiazoles were prepared (aryl groups, and m.p. of II given): Ph, 2-furyl, 103-3.5°; Ph, 2-thienyl, 117-18°; p-PhC6H4, p-PhC6H4, 229-30°; Ph, 1-C10H7, 120°; Ph, 2-C10H7, 122-4°; p-MeOC6H4, 2-C10H7, 148°; p-MeOC6H4, 1-C10H7, 142-3°; p-MeOC6H4, p-PhC6H4, 155°; p-IC6H4, p-IC6H4, 276°; p-FC6H4, p-FC6H4, 200-2°; p-ClC6H4, p-ClC6H4, 242-3°; p-MeOC6H4, p-MeOC6H4, 161-2°; 2-furyl, 2-furyl, 141-2°; 2-thienyl, 2-thienyl, 117-18°; 2-styryl, 2-styryl, 151-2°; 1-C10H7, 1-C10H7, 175-7°; 2-C10H7, 2-C10H7, 187-9°. 1,4-bis-(5-phenyl-1,3,4-oxadiazol-2-yl)benzene m.

L4 ANSWER 175 OF 177 HCAPLUS COPYRIGHT 2006 ACS on STN (Continued)
308-9°. The following 2,5-diaryloxazoles were prepd. (aryl groups, m.p. of I and m.p. of III given): p-PhC6H4, p-PhC6H4, 232-3°, 257-9°; 1-C10H7, 1-C10H7, 90-1°, 144-5°; p-PhC6H4, 1-C10H7, 163-4°, 131-2°; 2-C10H7, 1-C10H7, 127-8°, 140-1°; 2-C10H7, 2-C10H7, 187-8°, 203-4°; p-PhC6H4, 2-C10H7, 197-8°, 204-5°; 2-C10H7, p-MeOC6H4, 114-15°, 154-5°; p-PhC6H4, p-MeOC6H4, 160-7°, 185-7°. p-MeC6H4SO3Me (3.7 g.) and 3.7 g. 2,5-di(4-biphenylyl)oxazole heated 1.5 days at 100°, the viscous liq. cooled and dissolved in a small amt. MeOH, and the soln. dild. with dry Et2O and cooled gave 7.3 g. 2,5-di(4-biphenylyl)-3-methyloxazolium p-toluenesulfonate, m. 214-16°. Similarly were prepd. the 2,5-di-Ph analog, m. 170-2°, the corresponding perchlorate, m. 177-8°, and 2-(1-naphthyl)-5-phenyl-3-methyloxazolium p-toluenesulfonate, m. 144-5°.

AB Syntheses are described, and m.p. values and analytical data given for 12 derivs. of BzCH2NHCOR (I), 9 derivs. of RCOCH2NHCOR' (II), p-C6H4(COCH2NHBz)2 (III), (BzCH2NHCO)2 (IV), 5 derivs. of RCONHNHCOR' (V), 20 derivs. of PhC:CH.N:CR.O (VI), 2 derivs. of p-C6H4(C:N.CH:CR.O)2 (VII), 12 derivs. of RC:N.N:CR'.O (VIII), and 4 derivs. of RC:CH.NMeX:CR'.O (IX). I-V are merely intermediates for the preparation of the liquid solution scintillators VI-IX. I-IV, VI, and VII were prepared in general according to Lister and Robinson (C.A. 7, 326). V (R = Ph, R' = 2-furyl) was prepared by refluxing 50 g. BzOEt and 50 ml. 85% aqueous N2H4.H2O 15 min. and then 2 hrs. after adding 200 ml. EtOH; the resulting BzNHNH2 (79%), m. 111-130 (10 g.) was added to 9.6 g. furoyl chloride in 100 ml. C5H5N with stirring, and the mixture refluxed 20 min., and treated with H2O to precipitate 57% V, m. 223-4°. Other V were similarly prepared, and VIII from these according to Stolle [Ber. 32, 797(1899)]. IX (R = R' = Ph, X = p-MeC6H4SO3) (85%), m. 170-2°, was prepared by heating 1 day at 100° in an oil bath 2.2 g. VI (R = Ph) with 3.7 g. p-MeC6H4SO3Me cooling, adding MeOH to give a concentrated solution, and finally dry Et2O. The following 38 compds. have not been previously reported: (for VI, R and m.p. given) 2-FC6H4, 84-5°; 3-FC6H4, 69-70°; 4-FC6H4, 81-2°; 4-ClC6H4, 115-16°; 2,4-Cl2C6H3, 116-16.5°; 3,4-Cl2C6H3, 124.5-5.0°; 2-BrC6H4, 71-2°; 3-BrC6H4, 86-7°; 4-BrC6H4, 115-16°; 2-IC6H4, 78.5-9.5°; 3-IC6H4, 112-13°; 4-IC6H4, 130-1°; 2-MeOC6H4, 145-6°; 3-MeOC6H4, 79- 80°; 2-furyl, 68-9°; 2-thienyl, 67-8°; 2-naphthyl, 110-11°; 4-biphenylyl, 112-13°; 2-(5-phenyloxazolyl), 242-3°; 2,5-di(biphenylyl)oxazole, 232-3°; (for VII, R and m.p. given) Ph, 237-8°; 4-biphenylyl, 292-4°; (for VIII, R, R', and m.p. given) 4-FC6H4, 4-FC6H4, 200-2°, 4-ClC6H4, 4-ClC6H4, 242-3°; 4-MeOC6H4, 4-MeOC6H4, 161-2°; 2- furyl 2-furyl, 141-2°; 2-thienyl 2-thienyl, 117-18°; α-styryl, α-styryl, 151-2°; 1-naphthyl, 1-naphthyl, 175-7°; 2-naphthyl, 2-naphthyl, 187-9°; 4-biphenylyl, 4-biphenylyl, 229-30°; Ph, 2-furyl, 103-3.5°; Ph, 2-thienyl, 117-18°; Ph, 4-biphenylyl 166-7°; (for IX, R, R', X, and m.p. given) Ph, Ph, ClO4, 177-88°; Ph, Ph, p-MeC6H4SO3, 170-2°; 4-biphenylyl, 4-biphenylyl, p-MeC6H4SO3, 214-16°; Ph, 1-naphthyl, p-MeC6H4SO3, 144-5°. No syntheses of solvents were necessary, but their more complete purification probably accounts for apparent discrepancies between the present results and those of Kallman and Furst (C.A. 45, 10073h). A general comparative study of aromatic and aliphatic solvents shows the former, because of their resonance properties, able to transfer energy to the solute at lower levels. Emission spectra of 3 g./l. PhMe solns. of the 38 solutes were run with Ra excitation; energy transfer between solutes was noted by this method with PhMe solns. of 2 solute; and the absorption spectra in cyclohexane and the photon mean free path data were obtained. Relative photomultiplier anode current and pulse height methods

L4 ANSWER 176 OF 177 HCAPLUS COPYRIGHT 2006 ACS on STN (Continued)
of testing were applied, and the results gave information directly applicable to counting problems. Uses are described for these liquid soln. scintillators in H3 and C14 assay in work of biol. interest, natural C14 counting, and detection of the free neutrino.

AB AcNHCH(CO2Et)2 (660 g.) was added to a solution of 70 g. Na in 4 l. EtOH and the solvent removed in vacuo. The dry Na-salt was treated with 408 g. AcCH2Br(AcCH2Cl did not work) in boiling C6H6 for 48 h. The washed and dried C6H6 solution was evaporated to dryness. After dilution with Et2O the residue
gave 322 g. AcCH2C(CO2Et)2NHAc (I), m. 104-7° (from EtOH). I (160 g.) dissolved in 740 mL. AcOH was treated with 102 g. Br in 440 mL. AcOH at 70-80° for 4-5 min. and the solvent removed in vacuo. After dilution with Et2O the residue gave 130-5 g. CH2BrCOCH2C(CO2Et)2NHAc (II), m.
95-6° (from ligroine). II (100 g.) dissolved in 600 mL. Me2NCHO was treated with 52.8 g. K salt of phthalimide for 50-70 min. at 35-40°. After addition of 600 mL. CHCl3, the solution was washed with H2O, N NaOH, and 3N HCl and dried. Evaporation of the CHCl3 and addition of Et2O
gave 91 g. o-C6H4(CO)2NCH2COCH2C(CO2Et)2NHAc (III), m. 170-1° (from EtOH). III (8.2 g.) was refluxed in a solution of 1.7 g. LiOH in 200 mL. H2O
for 2.5-3 h., the pH adjusted to 3-4 with 48% HBr, and the solution boiled again for 30 min. Evaporation at pH 2-2.2 gave 3.2 g. o-C6H4(CO)2NCH2COCH2CH(CO2H)NHAc, m. 238-40° (from EtOH), slightly soluble in cold H2O, very soluble in hot H2O. III (16.4 g.) was refluxed in a
solution of 4.2 g. NaOH in 120 mL. H2O and 40 mL. EtOH for 2 h., then 30 min.
more after addition of HCl to pH 3-4. Addition of more HCl and evaporation gave a
residue which was dried and treated overnight at room temperature with 200 mL.
15% HCl in EtOH. The salt and alc. were removed and the residue crystallized
from H2O to give 5.4 g. o-C6H4(CO)2NCH2COCH2CH(CO2Et)NHAc, m. 172-4°. III (133 g.) was refluxed in 800 mL. concentrated HCl for 5 h., 1 l. H2O added to the green solution to precipitate o-C6H4(CO2H)2, and the filtrate
concentrated, filtered over C, and diluted with EtOH to give 67 g. NH2CH2COCH2CH(NH2)CO2H.2HCl (IV), m. 135-40°, which gave off HCl when crystallized from EtOH-H2O, forming the monohydrochloride, m. 256° (decomposition). IV (61 g.) was dissolved in 500 mL. H2O and treated at 90-100° with 61 g. KCNS over 30 min., the solution kept at 80-90° for 1 h., and filtered over C. Neutralization with Na2CO3.10H2O to pH 5 gave 26 g. DL-2-mercaptohistidine, decomposing at 300°. The phthalyl group in III and related compds. was stable to hydrazinolysis.
